846 OC_FULL_LICENSE_TEXT = """OMNI-COMPASS REFEREE ENGINE
847 SOURCE-AVAILABLE EVALUATION LICENSE
848 Version 1.0
849
850 Copyright (c) 2026 The Omni-Compass LLC. All rights reserved.
851 Creator / Developer of record: AJ Dubra.
852 Owner of record: The Omni-Compass LLC, a Delaware limited liability company.
853
854 THIS IS NOT AN OPEN SOURCE LICENSE. The source code is published so that it
855 can be read, audited, executed and independently verified. It is not published
856 for redistribution, for incorporation into other products, or for production
857 use.
858
859 1. DEFINITIONS
860
861    "Software" means the Omni-Compass Referee Engine source file(s) distributed
862    under this License, together with accompanying verification tooling and
863    documentation.
864
865    "Authentic Release" means a copy of the Software that is byte-identical to
866    a release published by the Licensor at the Official Source, as confirmed by
867    the published canonical SHA-256 digest for that release.
868
869    "Official Source" means https://www.omni-compass.com.
870
871    "Modified Copy" means any copy of the Software that is not an Authentic
872    Release, regardless of how small the difference is.
873
874    "Marks" means the names "Omni-Compass", "Omni-Compass", "Omni-Compass Referee
875    Engine", and any associated logos or product names of the Licensor.
876
```

2. GRANT

Subject to every condition below, the Licensor grants you a worldwide, royalty-free, non-exclusive, non-transferable, revocable license to:

(a) download and retain a copy of the Software;
(b) read, study, review and analyze the source code;
(c) execute the Software for the purposes of evaluation, verification, replication, benchmarking, academic study and internal assessment; and
(d) publish the results of that evaluation, including results that are critical of the Software, provided you comply with Section 5.

You may run the Software as many times as you wish, with any seed, and publish the resulting reports.

3. RESTRICTIONS

You may NOT:

(a) redistribute, republish, mirror, resell, sublicense or otherwise convey the Software or any part of it to any third party. Direct others to the Official Source instead;

(b) publish, distribute or make available any Modified Copy;

(c) use the Software in production, or as a component of any product or service offered to third parties, without a separate written commercial license from the Licensor;

(d) remove, disable, bypass, obscure or alter the authenticity self-check, the integrity digest, the authenticity banner, the provenance block, or any attribution or copyright notice contained in the Software;

(e) misrepresent the origin, authorship, provenance or authenticity of the Software or of any output it produces.

4. MODIFICATION AND MANDATORY RENAMING

You may modify your own copy of the Software for private study and testing.

If you make any modification, then that copy is a Modified Copy and:

(a) it MUST NOT be called Omni-Compass, Omni-Compass Referee Engine, or any name confusingly similar to the Marks;

(b) it MUST NOT display, print, embed or otherwise present any of the Marks in its output, documentation, interface, filenames or metadata;

(c) it MUST carry a clear notice, at the top of the source file and in all output it produces, stating that it is a modified derivative and is NOT the Omni-Compass Referee Engine;

(d) it MUST retain and MUST NOT alter the authenticity self-check, so that the modification remains detectable; and

(e) its output MUST NOT be presented, described, cited, published or implied to be Omni-Compass results, Omni-Compass performance, or evidence about the behavior, correctness or capability of Omni-Compass.

This condition follows long-established practice for reference implementations, most notably Donald Knuth's condition on TeX: a program that has been changed may not carry the original name.

5. TRUTHFUL ATTRIBUTION OF RESULTS

You are free to publish results, including negative results, criticism, benchmarks and failure reports. That freedom is deliberate. The Licensor invites scrutiny.

You must, however, when publishing any result attributed to the Software:

(a) state the canonical SHA-256 digest of the exact file you executed;
(b) state the Python version and the versions of all dependencies used, or state the digest of the published container image if one was used; and
(c) state the seed and any command-line arguments used.

Publishing output as Omni-Compass results when it was produced by a Modified

```
   Copy, or by an unstated or altered environment, is a breach of this License
   and may additionally constitute trademark infringement, false designation
   of origin, and commercial disparagement.

6. TRADEMARKS

   The Marks are the property of the Licensor and are NOT licensed under this
   License. No right to use the Marks is granted except the limited right to
   refer to the Software accurately and descriptively, in the manner of
   ordinary nominative fair use, when reporting Authentic Release results.

7. NO WARRANTY

   THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR
   IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY,
   FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT.

8. LIMITATION OF LIABILITY

   IN NO EVENT SHALL THE LICENSOR BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER
   LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING
   FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER
   DEALINGS IN THE SOFTWARE.

9. TERMINATION

   This License terminates automatically and immediately if you breach any of
   its terms. On termination you must destroy all copies of the Software in
   your possession. Sections 4, 5, 6, 7 and 8 survive termination.

10. GOVERNING LAW

   This License is governed by the laws of the State of Delaware, United States of America, without
   regard to its conflict of law provisions.

For commercial licensing, production use, or written permission for any use
not granted above, contact: AJ Dubra, The Omni-Compass LLC

    "\n"
    "COMPUTED text is produced by this execution: numbers, counts, rates, intervals, digests, "
```

Confidential. Evaluation and simulation use only; any other use requires a signed, paid Omni-Compass Enterprise License.

```
    "classifications and acceptance decisions. It is a consequence of the declared code and the "
    "declared configuration, it changes when the run changes, and it is falsifiable by "
    "re-execution.\n"
    "\n"
    "AUTHORED text was written in advance by The Omni-Compass LLC and is stored as literal string "
    "constants in the engine source. All doctrine, interpretation, reading rules, claim "
    "boundaries, disclaimers, rights and licensing language, and every question and answer in the "
    "Executive Discovery Blueprint is AUTHORED. THE ENGINE DID NOT CONCLUDE THESE THINGS. It "
    "printed sentences a person wrote. They are the owner's stated position on what the computed "
    "results mean, and they are open to challenge as reasoning and as representation, but they "
    "are not findings of the mathematics and must never be cited as though a program derived "
    "them.\n"
    "\n"
    "BOUND text is an authored sentence with computed values substituted into it. It carries the "
    "authority of its computed values and the accountability of its authored frame, and no more "
    "than either.\n"
    "\n"
    "WHY THIS IS STATED AT ALL. A reader could reasonably assume that a document generated by a "
    "mathematical engine represents the engine's conclusions throughout. That assumption would be "
    "wrong and would overstate this package. The mathematics establishes what the mathematics "
    "establishes; the surrounding prose is a human argument about its significance, written by an "
    "interested party. Omni-Compass would rather a reader discount the prose and test the numbers "
    "than accept the prose because a computer printed it.\n"
    "\n"
    "WHERE THE LINE FALLS IN PRACTICE. If a sentence contains a figure that would change on the "
    "next run, the figure is COMPUTED. If a sentence would read identically no matter what the "
    "run produced, it is AUTHORED. Disclaimers, claim boundaries and falsifiers are AUTHORED by "
    "design: they are commitments made in advance, deliberately not contingent on whether the "
    "results turned out well.\n"
    "\n"
    "This disclosure is itself AUTHORED text, hardwired in the engine source, and is emitted into "
    "every release so that no recipient of any artifact is left to infer the distinction."
)

OC_OWNER_DEVELOPMENTAL_EXECUTION_REPRESENTATION = (
    "WHY THE AUTHORED PROSE IN THIS PACKAGE IS WRITTEN WITH CONFIDENCE - OWNER REPRESENTATION\n"
    "\n"
    "A reader may fairly ask why the doctrinal text in this package states its positions plainly "
    "rather than hedging every sentence. The answer is a representation by The Omni-Compass LLC, "
    "and it is placed here rather than left to be inferred.\n"
    "\n"
    "The owner represents that this engine and its predecessors have been executed, re-executed, "
    "instrumented, broken, retuned and re-run continuously throughout development - across a very "
    "large number of executions, parameter settings, seeds, horizons, gains, tolerances and "
    "failure injections - long before any of it was published. The authored statements in this "
    "package are therefore written from repeated observation of this mechanism's behaviour. They "
    "are not speculation drafted around a single successful run.\n"
    "\n"
    "THAT DEVELOPMENTAL RECORD IS NOT OFFERED AS EVIDENCE IN THIS PACKAGE AND MUST NOT BE COUNTED "
    "AS ANY PART OF IT. It carries no manifest, no digest, no seed record and no artifact in this "
    "release. It explains the CONFIDENCE OF THE AUTHORED PROSE. It establishes nothing. Every "
    "quantitative statement anywhere in this package is bound to the executed campaign recorded "
    "in this run's manifest and to nothing else, and where this report states a run count, that "
    "count is the count of THIS campaign.\n"
    "\n"
    "The owner draws the line deliberately. A developmental history that a reader cannot inspect "
    "is worth exactly nothing as proof, and Omni-Compass declines to trade on it. What the reader "
    "can inspect is the engine, the seed, the digest, the raw rows and every artifact this "
    "execution wrote. Those are the proof. The representation above is context for why the prose "
    "reads the way it does, and it is falsifiable only as a representation about the owner - not "
    "as a result about the mechanism."
)

OC_FALSIFICATION_INVITATION = (
    "STANDING INVITATION TO FALSIFY - READ THIS BEFORE DECIDING WHETHER TO ENGAGE\n"
    "\n"
    "Omni-Compass does not ask to be believed. It asks to be tested, and it has been built so "
    "that testing it is possible without the owner's cooperation, permission or presence.\n"
    "\n"
    "Every consequential statement in this package names its evidence class, the artifact it "
    "rests on, and the specific finding that would destroy it. Those falsifiers are written in "
    "advance, before the results were known, and they are not decorative. The engine is published "
    "in full, the seed is published, the digest is published, and the raw rows are published. Any "
    "competent reviewer can execute it in their own environment, on their own hardware, at their "
    "own seed, and compare row for row.\n"
    "\n"
    "The owner's position is that the mechanism will withstand this. That position is not offered "
    "as proof of anything - it is a position, and the reader is under no obligation to share it. "
    "What is offered is the means to test it.\n"
    "\n"
```

Confidential. Evaluation and simulation use only; any other use requires a signed, paid Omni-Compass Enterprise License.

```
    "THE OWNER PUBLISHES ITS OWN DEFECTS. This release corrects blocking defects found by "
    "adversarial self-audit of the prior build, including an economic uncertainty interval that "
    "was materially understated, a reference implementation that departed from its published "
    "source algorithm, verification artifacts that were sealed out of the release package, and a "
    "comparator profile that was defined but not executed. Each is disclosed, corrected, and "
    "republished - including where the correction moved a result against the owner. A package "
    "that hides its own defects invites the reader to hunt for them. This one hands them over and "
    "moves the argument to the mechanism.\n"
    "\n"
    "IF A CLAIM HERE HAS NO PROOF BEHIND IT, THAT CLAIM IS WORTHLESS AND SO IS THE PACKAGE THAT "
    "CARRIES IT. The owner accepts that standard without qualification. It is the standard this "
    "package was built to, it is why every claim is tied to an artifact and a falsifier, and it "
    "is the standard by which the owner expects to be judged. A reviewer who finds an unsupported "
    "claim has found a real defect and is asked to report it; a reviewer who breaks a supported "
    "one has done something more valuable than agreeing with it.\n"
    "\n"
    "So: reproduce it, instrument it, stress it, attack the equations, attack the certificate, "
    "attack the economics, attack the code. That is the entire point of publishing it this way. "
    "The owner's expectation is that what survives is a mechanism, and what does not survive gets "
    "retuned - which is what engines do.\n"
    "\n"
    "This invitation is AUTHORED text. It is the owner's stated position, not a computed result."
)

OC_IMITATION_AND_PRIORITY_NOTICE = (
    "PRIORITY, IMITATION AND WHAT IS ACTUALLY BEING CLAIMED\n"
    "\n"
    "The owner is not aware of an equivalent published mechanism: a single unified supervisory "
    "convergence-control core that maintains one shared governing state across fragmented "
    "software, infrastructure, manager, controller and physical-actuator layers, and that forces "
    "and retains a declared operating basin through bounded derivative-level actuation under an "
    "explicit governing differential system. That is a statement of what the owner knows, not an "
    "adjudication of priority.\n"
    "\n"
    "PRIORITY IS NOT DECIDED BY THIS DOCUMENT. Novelty, originality, priority and scope are "
    "determined by prior-art examination and by official government records, which control. "
    "Nothing here is a representation that any right is registered, granted, cleared or "
    "enforceable, and this package asserts no patent claim.\n"
    "\n"
    "The owner expects imitation. A mechanism published openly enough to be reproduced is "
    "published openly enough to be copied, and that trade was made deliberately: a mechanism no "
    "one can inspect is a mechanism no one can trust. Derivative implementations, renamed "
    "variants and partial reconstructions should be anticipated. The marks, the license terms and "
    "the rename-on-modification condition govern what may be called Omni-Compass; they do not and "
    "cannot govern the mathematics, which is published so that it can be checked.\n"
    "\n"
    "What distinguishes the original is not secrecy. It is the authenticated source, the published "
    "digest, the executed evidence record, the falsifier discipline, and the fact that every claim "
    "is bound to an artifact a reader can open. An imitation that reproduces the mechanism without "
    "reproducing that evidence discipline is a copy of the equations and not of the position.\n"
    "\n"
    "This notice is AUTHORED text and is the owner's stated position."

EXECUTION_CONTRACT_TEXT = """
EXECUTION CONTRACT (RUNTIME ATTESTATION)
--------------------------------------------------------------------
This console output and all generated artifacts are emitted directly by
a live Python execution of this script.

The reported results are the exclusive consequence of:
  • the declared program logic
  • the runtime configuration snapshot
  • the sampled parameters drawn within declared ranges
  • the RNG state used during this execution

No paraphrase, substitution, omission, or post-processing is performed
by the engine when emitting its own reports and artifacts.

PARAMETER FIXITY + TUNABILITY NOTICE
------------------------------------
This run uses a fixed configuration snapshot (printed below) and sampled
parameters drawn within declared ranges.

These results are not absolute or maximal. A reviewer may strengthen,
weaken, accelerate, delay, or reshape basin capture and stability behavior
by adjusting configuration knobs and/or parameter ranges (e.g., basin_tol,
stability_window, macro_steps/cutoff, dt/micro_steps, forcing/coupling).

12777     meta = meta or {}
12778     snap = _oc_economic_benefit_model_snapshot(meta)
12779     lines = [
12780         "PRIMARY STACKS / CLUSTERS HEALTH PRINCIPLE: Omni-Compass value begins with the operating health of governed ST
      ACKS / CLUSTERS and authorized connected products, not with a staffing assumption. The governing core maintains shared
      state, evaluates admissibility, arbitrates conflicting local decisions, applies bounded correction, and retains an acqu
      ired operating basin so the controlled estate can spend less time oscillating, reconciling, retrying, over-scaling, rec
      overing, or operating outside its declared admissible condition.",
12781         "PROACTIVE GOVERNING MECHANISM: The mechanism is designed to act on the shared governing state while deviation
      is developing, subject to the authorized control envelope, rather than depending exclusively on fragmented downstream m
      anagers reacting after independent thresholds have already been crossed. The intended benefits are shorter deviation du
      ration, fewer repeated corrections, coordinated recovery, and lower avoidable operating stress. Production claims requi
      re matched telemetry and environment-specific validation.",
12782         "CPU / GPU / ACCELERATOR BENEFIT SURFACE: The integrated compute benchmark measures completed work together wit
      h powered CPU core-hours, powered GPU-hours, facility energy, peak power, queue delay, SLA behavior, makespan, and ther
      mal excursions. Lower powered resource-hours at equal completed work can reduce computational energy demand and the dur
      ation for which processors and accelerators remain electrically active.",
12783         "PRODUCT / HARDWARE PRESERVATION SURFACE: Verified reductions in powered work, peak demand, thermal exposure, r
      etries, oscillatory control, unnecessary state changes, or recovery cycles can reduce stress imposed on CPUs, GPUs, acc
      elerators, batteries, converters, power electronics, cooling systems, motors, robotics, edge devices, servers, storage
      systems, and other authorized hardware. Longer life, lower wear, maintenance reduction, battery-life extension, or repl
      acement deferral are validation targets, not automatic conclusions, and require device-specific longitudinal evidence."
      ,
12784         "ENERGY / THERMAL / COOLING SURFACE: Electrical work ultimately becomes heat. The report therefore traces compl
      eted useful work -> powered resource-hours -> electrical demand -> peak power -> thermal exposure -> cooling burden. Th
      is supplies a testable pathway from governing coherence to lower energy and heat-loading pressure without relabeling so
      ftware disorder as thermodynamic entropy.",
12785         "RELIABILITY / PREVENTION / CONTAINMENT / RECOVERY SURFACE: The enterprise and STACKS / CLUSTERS benchmarks mea
      sure failures, material outages, security incidents, availability, dropped work, recovery, incident severity, and relat
      ed loss surfaces under matched disturbances. Governance changes prevention, coordination, containment, and recovery whi
      le the common disturbance draw remains matched across comparison modes.",
12786         "SPEED / RESPONSE SURFACE: Piece I line (4) contains the bounded effective governing-drive term v_eff = chi(t)c
      *tanh(...), where c is the declared limiting-velocity parameter. Because |tanh(.)|<1 and |chi(t)|<=1, |v_eff|<=c. The e
      ngine may therefore report normalized near-limit v_eff/c behavior and executed convergence, event-time, reaction-time,
      latency, and throughput metrics. This is a computational governing-response statement; it is not a claim that physical
      information, packets, or signals were measured at 0.99 times the vacuum speed of light.",
12787         "MEMORY / NETWORK / STORAGE SURFACE: Reduced replication churn, queueing, rework, cache reload, duplicate contr
      ol actions, cross-system reconciliation, and unnecessary movement can reduce memory traffic, network transfer, egress,
      storage I/O, write amplification, and transfer latency per completed unit of useful work.",
12788         "DIRECT-MUSCLE / PHYSICAL-SYSTEM SURFACE: The same canonical governing state may be connected, through domain-s
      pecific adapters and safety contracts, above managers, between managers and actuators, or directly to operational muscl
      es. The current enterprise suite includes synthetic direct-actuator evaluations across motor, thermal, network, and pow
      er-grid plant families; the architecture additionally maps robotic, aerospace, vehicle, optimizer, estimator, and other
       bounded control interfaces without claiming universal superiority over specialized local controllers.",
12789         "CROSS-DOMAIN MARKET SURFACE: The source catalog spans executable or mapped families including compute, contain
      ers, network, storage, data, observability, security, automation, AI, scientific/HPC, robotics, automotive, aerospace,
      enterprise, logistics, edge/IoT, resilience, and governance. The common market benefit is not identical physics in ever
      y industry; it is a common supervisory function: shared state, admissibility, conflict arbitration, bounded correction,
       persistence, recovery coordination, and auditable authority across heterogeneous managers and muscles.",
12790         "SCIENTIFIC / HPC SURFACE: The declared muscle catalog includes scientific HPC, astrophysics/mission analysis,
      and multidisciplinary optimization. Potential benefits include coordinated scheduling, resource placement, reduced queu
      e and retry burden, accelerator utilization, reproducible decision replay, bounded recovery, and lower energy per compl
      eted scientific workload, subject to workload-specific validation.",
12791         "AI / OPTIMIZATION SURFACE: AI inference/training resources, Adam-style optimizers, schedulers, and heterogeneo
      us accelerators are represented as governed or mapped muscles. The supervisory value proposition is cross-layer coordin
      ation of resource, policy, safety, and recovery decisions; the report does not claim to replace the specialized learnin
      g or optimization mathematics itself.",
12792         "ROBOTICS / AUTOMOTIVE / AEROSPACE SURFACE: ROS 2 graphs, industrial robotics, autonomous-vehicle perception/pl
      anning/control, flight control, propulsion/thermal workloads, satellite telemetry/command, motors, and other actuators
      are mapped as domain surfaces. Benefits to be tested include bounded command arbitration, coordinated fault response, e
      nergy/thermal management, reduced conflicting control, recovery behavior, and product-hardware preservation under domai
      n safety constraints.",
12793         "EDGE / IoT / REMOTE-SYSTEM SURFACE: Edge fabrics and intermittent-link environments can benefit from shared st
      ate, bounded local authority, fallback, recovery, reduced duplicated coordination, and explicit partition/latency handl
      ing. Actual distributed-scale capability remains constrained by telemetry throughput, fan-in, latency, redundancy, part
      itioning, and compute capacity.",
12794         "SECURITY / GOVERNANCE / AUDIT SURFACE: The architecture exposes least-privilege authority modes, command rejec
      tion, override, rollback, kill switch, fallback, decision replay, provenance, telemetry consensus, and audit surfaces.
      Security benefit is a measurable governance hypothesis; no immunity from compromise or production security certificatio
      n is claimed.",
12795         "STACK-TAX ACCOUNTING PRINCIPLE: STACKS / CLUSTERS tax is the financial translation of avoidable fragmentation
      burden after the technical surfaces are measured. It may include compute, accelerator, memory, network, storage, power,
       cooling, incidents, recovery, tooling, integration, maintenance, facilities, support, and any independently verified s
      upervisory operating cost. The customer decides where verified dollars belong in its ledger; no workforce reduction is
      presumed or promoted.",
12796         "AGGREGATE-BENEFIT PRINCIPLE: Verified benefit surfaces may be combined only after causal overlap is assigned o
      nce. Gross benefit is not net benefit until implementation, migration, training, security, residual-license, governance
      , transition, ongoing operating cost, and quantified risk are deducted.",
12797         "CLAIM BOUNDARY: Canonical trajectories and numerical checks are executed computational records; compute, manag
      er, enterprise, public-manager, and Megastack surfaces are executed synthetic or digital-twin evidence unless a report
      explicitly identifies physical telemetry. Physical lifetime, battery endurance, maintenance, customer savings, safety c

13978         "",
13979         f"Mechanism and interpretation of the recorded result: every trajectory is advanced through the canonical eight
      -line Piece I state dynamics by RK4 over 20 macro steps and 10 microsteps per macro step. The raw U differential equati
      on uses the declared symmetric double-well term mu U(1-U^2), with stable wells at +/-1. At Step 0, the nearest signed b
      asin is assigned as the supervisory target. At each microstep, the bounded FF+P ZOH controller acts through the derivat
      ive-level command u to capture and preserve that same +/-0.10 basin without any post-RK4 state overwrite. CONVEY-5 requ
      ires five consecutive same-basin observations, and CERT-10 requires ten. Under the recorded initial U in [-1, +1] distr
      ibution, sampled parameter ranges, finite horizon, and active signed-target regulation, all {total} runs satisfied both
       criteria.",
13980         "",
13981         f"Engineering meaning: this execution demonstrates complete capture and retention for the finite tested populat
      ion, not a theorem for arbitrary external systems. The mean conveyance entry was {summary.get('mean_step')} macro steps
      , the median was {summary.get('median_step')}, the 95th percentile was {summary.get('p95_step')}, and the latest observ
      ed entry was {summary.get('max_step')}, all within the declared latest conveyable entry limit of step {LATEST_CONVEYABL
      E_ENTRY_STEP}. Born-in-basin runs were already admissible at step 0; rescued/self-tuned runs entered through closed-loo
      p correction. The quadrant percentages are aggregate trajectory-phase occupancy measurements derived from the executed
      state histories and are not presented as independent physical domains.",

16717
16718         for _ln in """Runtime Binding & Outcome Dependence
16719
16720 This section records the complete numeric parameter configuration under which the Omni-Compass Unified Governing Conver
      gence Control Core Engine was executed for the Monte Carlo batch reported herein.
16721
16722 The canonical governing equation, state topology, saturation law, basin-directed correction, dwell criteria, and retain
      ed-basin regulation define the mechanism. The parameter values listed above instantiate the quantitative operating poin
      t used in this run.
16723
16724 Parameters tune rate, force, damping, transient shape, capture interval, control effort, and operating smoothness. They
       may accelerate, delay, strengthen, soften, or reshape conveyance while the governing mechanism remains structurally un
      changed.
16725
16726 All numerical results, classifications, metrics, figures, and artifacts in this execution are direct consequences of th
      e recorded parameter values, initial conditions, wiring, seed, horizon, and configuration. Alternative parameterization
      s require their own execution record and may produce different quantitative trajectories.
16727
16728 The Omni-Compass mathematical position is mechanism-dominant and parameter-flexible: conveyance is generated by the can
      onical topology rather than by one privileged parameter tuple, provided the signs, bounds, admissibility conditions, nu
      merical stability, and integration wiring remain valid. Values that violate those conditions are not equivalent admissi
      ble implementations.
16729
16730 Accordingly, this report binds its measured numbers to the disclosed configuration while preserving the separate declar
      ed position that multiple admissible parameter sets can achieve conveyance at different speeds, strengths, and interval
      s.""".split("\n\n"):

        _APPENDED_12_22_TEXT = r"""12. SENSITIVITY / DRIVER SUMMARY
--------------------------------------

This subsection ranks the strongest measured drivers observed during the run,
based on the emitted draws and the executed configuration snapshot.

Reported items include:
• Parameter key / driver name
• corr_steps (correlation vs. steps-to-convey / convergence step behavior)
• corr_rms (correlation vs. RMS behavior)
• sample count (n) used in the correlation estimate

If the run emits insufficient history to compute RMS and/or sensitivity
correlations, the engine will state that directly for this execution.

13. OBSERVED BEHAVIORS, REGIMES & EMERGENT DYNAMICS
-------------------------------------------

This section is restricted to classifications actually present in the current
raw run rows. The authoritative counts are the Section 9 regime table, the
U_history records, the basin-entry and dwell fields, and the machine-readable
CSV/JSONL artifacts. No unobserved category is listed as though it occurred.

The engine distinguishes uncontrolled continuous-flow behavior from the bounded
derivative-level control contribution. A trajectory may be described as
monotone or oscillatory only when that label is computed from its recorded
U_history. Divergence, switching, late migration, noise response, and other
behaviors are reported only when their corresponding executed fields or
dedicated evidence-suite records are nonzero. Conceptual possibilities are
not promoted to current-run observations.

14. PURPOSE

The Omni-Compass Unified Governing Convergence Control Core Engine is designed to

UNIFIES TERMINOLOGY CLARIFICATION

The term 'unifies' refers to basin capture and retained-state behavior produced by the complete hybrid mechanism: continuous Piece I flow followed by the declared microstep P_sigma regulation/projection. It does not mean report-time alteration, deleted failures, artificial early termination, or post-execution coercion of recorded trajectories.

execute large-scale
Monte Carlo simulations of the canonical eight-line Piece I continuous flow
combined with the explicit bounded zero-order-held RK4 microstep operator in order to
characterize basin capture, conveyance, certification, regulation effort, bath
residual consistency, and full-horizon behavior under controlled parameter
sampling.

The engine functions as a trajectory-based unification and measurement system.
It is not a symbolic solver and does not assert closed-form analytical
solutions.

Each Monte Carlo run represents one independent trajectory governed by the
same complete hybrid operator, symbol set, classification rules, and execution
logic, with variation arising from sampled initial conditions and runtime
parameters.

The purpose of this execution is to measure, validate, and demonstrate the
behavioral properties of the Omni-Compass Unified Governing Convergence Control Core Engine as a
core infrastructural system under the declared configuration.

15. SCOPE

PARAMETER SAMPLING DISCLOSURE

Unless explicitly declared as fixed, runtime parameters are sampled independently using uniform distributions over their declared bounds. No adaptive resampling or post-hoc parameter adjustment is performed.

This execution evaluates a fixed governing equation and symbol table under
a declared runtime configuration and parameter ranges. Each Monte Carlo run
represents one independent trajectory with sampled initial conditions and
parameters.

Outputs include:
- Aggregate statistical summaries
- Stability and conveyance classifications
- Representative raw trajectory disclosures
- Full machine-readable datasets (CSV / JSONL)
- Human-auditable PDF reports

SYMBOL SCOPE CLARIFICATION

The Omni-Compass symbol chart defines the full conceptual framework of the system. This execution evaluates a single declared governing equation and runtime configuration within that broader symbol space.

The scope of interpretation is strictly limited to the executed configuration,
parameter ranges, and stability rules embedded in this run. No claims beyond
this execution context are implied.

16. ENGINE BEHAVIOR, METHODOLOGY & PROTOCOL

This section defines the execution methodology and operational protocol used by the Omni-Compass Unified Governing Convergence Control Core Engine during runtime. The engine is an empirical Monte Carlo trajectory executor. It performs direct time-stepped simulation of the canonical governing equation under a declared runtime configuration and parameter sampling procedure.

METHODOLOGY (AS EXECUTED)

RANDOMNESS & STOCHASTIC SAMPLING DISCLOSURE

All stochastic sampling and noise injection in this execution are generated using Python's standard pseudorandom number generator. Random seeds are initialized per batch execution. Given identical code, configuration, and seed state, this engine is designed to reproduce identical classification outcomes within numerical precision limits.

1) Initialization
Each trajectory run is initialized by:
- Sampling or assigning initial conditions for all state variables referenced by the governing equation

Confidential. Evaluation and simulation use only; any other use requires a signed, paid Omni-Compass Enterprise License.

• Sampling or assigning runtime parameters within declared bounds
• Applying any declared schedules, caps, saturation limits, and clamps prior to stepping
• Establishing run identifiers, seed state, and reproducibility metadata

2) Time-Stepped Integration
Each trajectory evolves via discrete stepping across a fixed step horizon. At each step the engine:
• Evaluates forcing inputs and noise terms as configured
• Computes state increments implied by the governing equation
• Applies saturation behavior (e.g., tanh-based limiting) as defined
• Applies clipping, bounds enforcement, and numeric safety constraints as configured
• Records step history for classification, RMS, and diagnostics

3) Stability and Conveyance Evaluation
STABILITY CRITERIA DISCLOSURE

Stability and conveyance are defined operationally by the criteria implemented in this engine, including windowed convergence tests, tolerances, and RMS thresholds. Alternative stability definitions may yield different classification outcomes.

During stepping, the engine evaluates stability and conveyance according to the embedded criteria. These criteria may include:
• Basin capture / basin center proximity checks
• Windowed stability checks across a declared stability window
• Threshold checks (tolerances, bands, and RMS criteria)
• Rescue logic (if defined) to detect and mediate transient divergence.
A trajectory is classified immediately upon meeting the declared stability or termination conditions, without requiring completion of the full step horizon unless required by configuration.

4) Classification Protocol
Each run is assigned exactly one outcome classification. Canonical outcome categories include, but are not limited to:
• Conveyed (stable basin capture achieved under criteria)
• Unconveyable (no stable capture within step horizon)
• Born in Basin (stable at initialization under criteria)
• Rescued (stability achieved via rescue-mediated convergence).
Additional regime labels may be assigned based on observed convergence mode, including monotonic or oscillatory convergence behaviors, as defined by the execution logic. No trajectory is left undefined. No trajectory is dropped.

5) Ensemble Aggregation
After all trajectories execute, the engine computes aggregate statistics and diagnostics, including:
• Total run counts and category counts
• Conveyance and unconveyance rates
• Steps-to-conveyance summary statistics
• Stability mode breakdowns
• RMS metrics and robustness summaries (if enabled)
• Sensitivity / driver correlations (if enabled)

PROTOCOL (OUTPUTS AND TRACEABILITY)
All outputs are generated programmatically from executed runtime data. The engine produces:
• Console executive summary (human-readable)
• Report sections populated from computed results
• Visual distributions and plots (when enabled)
• Machine-readable datasets (CSV / JSONL) where configured
• Run identifiers and configuration hashes for traceability.
All reported values correspond to executed configuration and recorded run data. No manual edits, symbolic reduction, or post-processing is applied to reported results.

FAILURE MODES AND SAFETY CONTROLS
The engine enforces numeric and execution safeguards, which may include:
• Detection of divergence or runaway values
• Clipping and saturation enforcement
• Bounds adherence checks for sampled parameters
• Hard termination rules under invalid numeric states (NaN/Inf), if enabled.
If any safeguards trigger during execution, the engine reports that status explicitly in the appropriate diagnostics sections.

REPRODUCIBILITY
When executed under identical configuration and random seed state, the engine is designed to reproduce identical classification outcomes and numeric outputs within the deterministic limits of the selected runtime mode and numeric precision.

17. EXECUTIVE CONTRACT (INTERPRETATION & USE)

This section constitutes the executive-level interpretive and use contract governing the reading, application, and reliance upon the contents of this report and all associated outputs generated by the Omni-Compass Unified Governing Convergence Control Core Engine.

INTERPRETATION
All results, metrics, classifications, analyses, and visual artifacts presented herein are to be interpreted strictly within the context defined by the governing equation, symbol table, runtime configuration, Purpose, and Scope sections of this report.

Confidential. Evaluation and simulation use only; any other use requires a signed, paid Omni-Compass Enterprise License.

No section, metric, figure, or statement shall be interpreted in isolation or construed beyond the execution context under which it was produced.

USE AND RELIANCE

This report and its outputs are provided for technical evaluation, verification, analytical review, and decision-support purposes consistent with the permissions and restrictions defined elsewhere in this document.

Reliance upon the results for operational, commercial, regulatory, safety-critical, or high-stakes decision-making is subject to the execution of appropriate licensing agreements, validation procedures, and independent review as determined by the user.

NO WARRANTY OR GUARANTEE

The results presented herein represent empirical observations derived from executed simulations. No guarantees, warranties, or assurances of future performance, correctness under untested conditions, or suitability for specific applications are expressed or implied.

FINALITY OF RECORD

This report constitutes a complete and self-contained record of the executed run(s) described herein. No external documents, verbal statements, or supplementary materials shall modify or supersede the contents of this report absent explicit written amendment issued by The Omni-Compass LLC.

18. AVAILABILITY, RIGHTS, CONDITIONS & RESTRICTIONS

Availability to The Omni-Compass Unified Governing Convergence Control Core Engine is provided for simulation, testing, evaluation, validation, verification, and technical engagement under defined permissions, with commercial exploitation and operational deployment governed through formal agreements.

PERMITTED TECHNICAL USE

The Omni-Compass engine may be accessed, executed, tested, simulated, evaluated, validated, verified, and analyzed for technical, internal, educational, or review purposes without the purchase of a commercial license.

Permitted technical use includes:

- Simulation and execution testing
- Validation and verification of behavior and outputs
- Benchmarking and analytical review
- Technical inspection of governing equations and structure
- Internal research and exploratory analysis
- Preliminary non-commercial personal use

Permitted technical and personal use is expressly limited to preliminary confirmation that The Omni-Compass engine performs as represented, including confirmation that it functions as a unification engine and infrastructure-grade system.

Such use is authorized solely for the purpose of determining suitability, capability, validity, and alignment.

Permitted use does not grant any right to monetize, commercialize, embed, distribute, sublicense, or derive revenue from The Omni-Compass engine or its outputs.

PUBLIC AVAILABILITY AND CONSENT

Written consent for the permitted technical uses described herein is granted by the lawful possession, access, and execution of The Omni-Compass code and its governing equation, which are publicly available and readily obtainable.

Execution of the code and use of the published governing equation constitute affirmative permission to perform simulation, testing, evaluation, validation, verification, and analytical review within the bounds stated in this Availability section.

COMMERCIAL LICENSING

Commercial licensing is required for any use of The Omni-Compass engine or its outputs that supports revenue generation, monetization, productization, operational deployment, paid services, or sustained integration.

For clarity, commercial use includes any use of The Omni-Compass engine, in whole or in part, as:

- A component of any software stack or system
- A module, service, daemon, library, or background process
- A decision, control, optimization, or coordination layer
- An input to, dependency of, or influence on business operations
- A function embedded within products, platforms, pipelines, or services
- Any capability contributing to the operation, efficiency, or outcomes of a company, corporation, enterprise, or organization

Any use of The Omni-Compass engine by a business entity, or within the operational functionality of a business, whether direct or indirect, whether labeled “core,” “supporting,” or otherwise, is considered commercial use.

Use of The Omni-Compass engine as a persistent, continuously operating, embedded, or recurring component within any system beyond preliminary testing and confirmation constitutes commercial use.

Any such use without an executed commercial license agreement is deemed an unauthorized deployment and a material breach of the permissions granted herein.

19. LICENSING PATHWAYS, DEPLOYMENT & COMMERCIAL TRANSITION

This section defines the pathways by which The Omni-Compass Unified Governing Convergence Control Core Engine may transition from permitted technical use into licensed commercial deployment.

All commercial use of The Omni-Compass engine is governed exclusively by executed licensing agreements issued by The Omni-Compass LLC. No commercial rights are granted implicitly, by access, or by technical capability alone.

Omni-Compass is proprietary and all rights are reserved. Commercial use, monetization, production deployment, embedding, productization, paid-service use, or sustained operational integration requires a separately executed written license and applicable authorization. This new-mechanism release presently uses an introductory, nonbinding planning benchmark equal to 10% of independently verified and contractually accepted value captured. The company-specific dollar amount, value basis, percentage, and terms may change, be withdrawn, or be negotiated, and the benchmark is expected to increase as validation, demand, adoption, authorized reach, support burden, scarcity, and strategic value increase. Only a definitive executed agreement controls. Benchmark dollar figures are not guaranteed customer results or binding commercial terms.

LICENSING PATHWAYS

Commercial licensing pathways may include, but are not limited to:

- Evaluation-to-production transition licenses
- Research and development licenses
- Embedded or integrated system licenses
- Enterprise-scale operational licenses
- Exclusive or territory-specific licensing agreements
- Long-term stewardship or acquisition-related licenses

Each pathway defines specific terms governing scope of use, deployment context, operational duration, usage scale, modification rights, and economic consideration.

DEPLOYMENT CLASSIFICATIONS

Licensed deployment may be classified according to use context, including:

- Internal operational deployment
- Customer-facing product integration
- Decision-support or control-layer deployment
- Persistent background or service-based execution
- Distributed, cloud-based, or edge deployments

Deployment classification determines applicable licensing terms, compliance requirements, and audit conditions.

COMMERCIAL TRANSITION

Transition from technical evaluation to commercial deployment occurs only upon:

- Execution of a formal commercial license agreement
- Satisfaction of required financial consideration
- Explicit authorization of deployment scope and classification
- Issuance of licensed materials or credentials, if applicable

Any deployment, integration, or operational use of The Omni-Compass engine prior to completion of this transition is considered unauthorized.

NO IMPLIED RIGHTS

The existence of technical documentation, executable code, reports, or demonstrated capability does not constitute a grant of commercial rights.

All commercial transition decisions, licensing approvals, and deployment authorizations are issued solely by The Omni-Compass LLC. under executed agreement.

20. OUTPUTS & ARTIFACTS

PERFORMANCE & RESOURCE USAGE (MEASURED)

This execution reports measured wall-clock runtime and peak process memory usage
for the Monte Carlo batch completed in this run. These values are recorded directly
by the executing Python runtime.

Measured values:

- runtime_seconds: <runtime_seconds>
- peak_rss_mb: <peak_rss_mb>
- platform: <platform>
- python: <python_runtime>

SCALING EXPECTATION

This engine is an embarrassingly-parallel Monte Carlo executor. Runtime scales
approximately linearly with the number of independent trajectories, while memory
does not grow with run count beyond configured history retention and artifact output.

This section enumerates all outputs and artifacts generated by the execution of the Omni-Compass Unified Governing Convergence Control Core Engine.

All outputs listed herein are produced directly by executed Python runtime logic and correspond to the governing equation, symbol set, runtime configuration, and Monte Carlo procedures described elsewhere in this report.

GENERATED OUTPUTS
The execution may generate, but is not limited to, the following artifacts:
• Console execution summaries
• Aggregate statistical reports
• Classification and conveyance summaries
• Stability and RMS metrics
• Diagnostic tables and summaries
• Visual plots, charts, and distributions
• Representative trajectory disclosures
• Machine-readable datasets

ARTIFACT CHARACTERISTICS
All artifacts:
• Are generated programmatically during execution
• Reflect actual runtime data and computed results
• Are not manually edited or post-processed
• Are reproducible under identical configuration and random seed
• Are traceable to a specific execution instance via identifiers

Artifacts may be emitted in multiple formats and destinations, including console output, file system storage, and report embedding, as defined by the execution configuration.

If specific outputs or artifact types are not generated for a given execution, this section will explicitly state their absence.

21. ARTIFACT FORMATS & ACCESS

This section defines the formats, structures, and access characteristics of all artifacts generated by the Omni-Compass Unified Governing Convergence Control Core Engine.

All artifacts described herein are generated programmatically during executed runtime sessions and correspond directly to recorded configuration, identifiers, and computed results.

ARTIFACT FORMATS
Generated artifacts may be emitted in one or more of the following formats, as determined by execution configuration:
• Human-readable documents (PDF)
• Console output logs
• Structured tabular data (CSV)
• Line-oriented structured data (JSONL)
• Serialized configuration and metadata snapshots
• Image-based plots and figures (PNG or equivalent)

All formats are produced directly from runtime data without manual editing or post-processing.

ACCESS CHARACTERISTICS
Artifacts are made available according to execution context and configuration, which may include:
• Local filesystem output
• Designated output directories per run or batch
• Deterministic file naming tied to run identifiers
• Timestamped and hash-linked artifact grouping

Access to artifacts is read-only by default and reflects the exact state of the executed run.

TRACEABILITY AND LINKAGE
Each artifact is traceable to a specific execution instance via:
• Run ID
• Batch ID
• Configuration hash
• Execution timestamp

Artifacts generated from the same execution share consistent identifiers and may be cross-referenced programmatically or manually.

RAW DATA ACCESS
For executions configured to emit raw data disclosures, machine-readable raw datasets are provided as part of the full technical artifact set. These raw artifacts contain unaggregated numeric values exactly as produced during runtime and are not altered, filtered, or normalized beyond execution logic.

Raw data artifacts are segregated from executive summaries and interpretive sections to preserve clarity and auditability.

NO IMPLIED AVAILABILITY
The existence of an artifact format does not imply public or unrestricted access. Artifact access and distribution remain subject to the permissions, restrictions, and licensing conditions defined elsewhere in this report.

22. VERIFICATION, EXECUTIVE IDS & TIME

Confidential. Evaluation and simulation use only; any other use requires a signed, paid Omni-Compass Enterprise License.

```
17316  ---------------------------------------------
17317
17318  This report and all associated outputs were generated by an executed Python runtime session.
17319
17320  The Omni-Compass Unified Governing Convergence Control Core Engine was run, evaluated, and verified by Python at the ti
       me and date recorded below. The Python interpreter actively executed the governing equations, runtime configuration, an
       d Monte Carlo procedures that produced the results contained in this report.
17321
17322  The timestamp reflects the actual execution time of the simulation, not a post hoc annotation or manual entry.
17323
17324  Python Runtime Verification:
17325  • Interpreter: Python (runtime recorded during execution)
17326  • Execution Mode: Direct execution of Omni-Compass engine code
17327  • Verification Basis: Successful completion of simulation, classification, and output generation without runtime error
17328
17329  Execution Timestamp:
17330  • Date: <YYYY-MM-DD>
17331  • Time: <HH:MM:SS>
17332  • Timezone: <UTC offset>
17333
17334  Run Identifier:
17335  • PERF: runtime_seconds=<runtime_seconds>, peak_rss_mb=<peak_rss_mb>
17336  • Run ID: <UUID or hash>
17337  • Configuration Hash: <hash of parameters/config>
17338  • Code Fingerprint: <source fingerprint>
17339
17340  This section certifies that the results presented herein were produced by an actual Python execution of the Omni-Compas
       s engine under the recorded environment and configuration.
17341

The strongest unconditional stability statement supplied by the current operator is jump-wise, not full-step: for W(U)=(U-sigma)^2, the canonical P_sigma/R_basin jump satisfies W(P_sigma(U))<=W(U), with strict decrease for pre-jump states outside the signed basin. This is H7 and is machine-checked over the declared audit grid. It must not be rewritten as W_{m+1}<=W_m for the entire bounded zero-order-held RK4 map unless the intervening RK4 map is separately shown non-expansive or contractive relative to the same basin metric.",
            "Exact S-channel dissipation. With Phi(S)=0.5 alpha_s S^2 + 0.25 beta_s S^3 - delta S and dS/dt=-dPhi/dS, the isolated S-channel obeys dPhi/dt=-(dPhi/dS)^2<=0 exactly. The correct Lyapunov candidate around a stable equilibrium is the shifted potential V_S=Phi(S)-Phi(S*), not the unshifted Phi unless the origin and parameters make that form positive definite. If Phi''(S*)>0 at an isolated critical point, V_S is locally positive definite and gives the conditional local result H8.",
            "Discrete barrier certificate. For h_sigma(U)=BASIN_TOL^2-(U-sigma)^2 and implementation margin m=max(EPS,BASIN_TOL*1e-9), the canonical post-projection clamp gives |U+-sigma|<=BASIN_TOL-m, hence h_sigma(U+)>=2*BASIN_TOL*m-m^2>0 for every finite pre-projection U. This is an exact one-jump reachability and sampled-state invariance certificate for the locked signed basin. It is stronger than a finite grid observation but does not claim continuous-time safety between projection events.",
            "Conditional S-flow contraction. Since F_state'(S)=-alpha_s-(3/2)beta_s*S, any interval I with alpha_s+(3/2)beta_s*S>=mu>0 is contractive for the isolated S dynamics. Solutions that remain in I satisfy |S1(t)-S2(t)|<=exp(-mu*t)|S1(0)-S2(0)|. This supplies an explicit contraction margin and promotion gate without extending the result to the coupled six-state system.",
            "Local Lipschitz proposition. On any compact domain D on which E_max is bounded below by a positive constant, the continuous Piece I vector field is continuously differentiable because it is composed of polynomials, tanh, cosine, affine terms, and divisions only by E_max and Q_B bounded away from zero. Therefore f is Lipschitz on D with an explicit computable bound L_D = sup_{x in D,t in [0,T]} ||J_f(x,t)||. The complete Jacobian entries are determined by the printed equations; the finite numerical evidence reports sampled local stiffness diagnostics but is not represented as the global supremum L_D.",
            "RK4 error bound. If f has bounded derivatives through order five on D and the exact and numerical solutions remain in D, classical RK4 has local truncation error O(h^5) and global error O(h^4). A conservative global form is ||e_n|| <= ((exp(L_D T)-1)/L_D) C_5 M_5 h^4, where M_5 bounds the required fifth total derivative and C_5 is the RK4 method constant. The report separately supplies observed refinement order and DOP853 concordance; those measurements validate the tested execution but do not replace the stated assumptions.",
            "Projection non-expansiveness theorem. For a declared signed basin interval I_sigma=[sigma-tau,sigma+tau], the scalar clipping projection Pi_I is 1-Lipschitz: |Pi_I(a)-Pi_I(b)| <= |a-b|. Because P_sigma leaves the other five coordinates unchanged, its Euclidean extension is non-expansive. Proof: metric projection onto a closed convex interval is non-expansive; applying the identity to the remaining coordinates preserves the inequality.",
            "Conditional Banach theorem. Let R_h be the one-microstep RK4 map restricted to a complete metric subset X of the declared basin, and suppose ||R_h(x)-R_h(y)|| <= q||x-y|| for q<1. Since P_sigma is non-expansive, ||P_sigma R_h(x)-P_sigma R_h(y)|| <= q||x-y||. Banach's fixed-point theorem then gives one fixed point in X and geometric convergence from every initial point in X. The engine does not claim that q<1 has been established globally; the theorem identifies the exact additional condition required.",
            "Conditional local Lyapunov theorem. For an equilibrium x* of a continuously differentiable active subsystem with Hurwitz linearization A, choose Q positive definite and solve A^T P + P A = -Q. If the nonlinear remainder obeys ||r(z)|| <= gamma||z||^2 locally, V(z)=z^T P z decreases for ||z|| < lambda_min(Q)/(2||P||gamma). The reported 5/6 vector-field Jacobian rank is not a controllability test: I_U is an observer channel absent from the other derivatives. A separate input matrix and controllability/observability analysis are required before any full-state control claim.",
