22260         # Protected service controls are recomputed from the declared reference
22261         # law, not replayed from a baseline trace. The raw Piece I proposal is
22262         # retained in the ledger, but any cap or deferral divergence is projected
22263         # out because the present simulator does not yet provide a theorem that
22264         # such divergence is service-nonregressive over the full horizon.
22265         # =====
22266         # SERVICE-NONREGRESSION CERTIFICATE (cap channel)
22267         #
22268         # Previously this gate projected out EVERY cap divergence
22269         # unconditionally, because "the present simulator does not yet
22270         # provide a theorem that such divergence is service-nonregressive
22271         # over the full horizon." Measured consequence: the cap channel
22272         # accepted 0.000% of proposals across every mode and seed, so the
22273         # supervisory core drove only the sleep channel and the reported
22274         # compute figures were the reference law's figures.
22275         #
22276         # Measured consequence of removing the gate entirely (the
22277         # omni_raw_candidate arm): CPU -4.16% and MIXED -3.81% facility
22278         # energy, but p95 queue rising from 0 to >100 minutes and SLA
22279         # misses appearing where there were none; GPU regressed on every
22280         # axis simultaneously (+11.03% energy, SLA 0.067 -> 0.115).
22281         # The blanket gate was therefore correct in effect and wrong in
22282         # method: it blocked a real regression by blocking everything.
22283         #
22284         # The certificate below admits a cap deviation only when it is
22285         # provably service-nonregressive AT THE STEP, on quantities the
22286         # simulator already computes:
22287         #
22288         # C1 Direction. Only a cap ABOVE the reference is admissible.
22289         # A lower cap buys energy by slowing work; that is the
22290         # regression the original doctrine refused, and it stays
22291         # refused.
22292         # C2 Queue safety. No job is waiting and no deadline is at
22293         # risk, so raising the cap cannot displace queued service.
22294         # C3 Thermal and power headroom. The preceding state must sit
22295         # below the declared throttle and limit fractions, so the
22296         # deviation cannot induce a violation it would then have to
22297         # correct.
22298         # C4 Bounded magnitude. The deviation is clipped to a declared
22299         # envelope so a single step cannot move the plant outside
22300         # the region in which C1-C3 were evaluated.
22301         #
22302         # C1-C4 are evaluated from current state, never replayed from a
22303         # baseline trace. Every decision is counted, so the acceptance
22304         # rate per channel is a reported quantity rather than an
22305         # assumption.
22306         # =====
22307         # MEASURED OUTCOME OF THIS CERTIFICATE (cpu mode, 477 decision steps):
22308         # C1 direction satisfied on only 3.6% of steps. The core's proposal
22309         # lies BELOW the reference cap on 96.4% of steps, mean deviation
22310         # -0.0725. That is the core asking to cap power down, which buys
22311         # energy by slowing work -- confirmed by the ungated arm at -4.16%
22312         # energy against +128 minutes of p95 queue delay.
22313         #
22314         # The low acceptance rate is therefore a PROPERTY OF THE PROPOSAL,
22315         # not an artefact of a conservative gate. A supervisory law that
22316         # wants to raise the cap into genuine headroom would be admitted by
22317         # C1 immediately. This is the specific, falsifiable finding that
22318         # tells the author what to change in the control law if the cap
22319         # channel is to carry value: the proposal must exploit headroom,

29310     return f"""# Public Enterprise Manager Mechanism Benchmark - Mathematical Contract
29311
29312 ## Scope
29313 Only publicly obtainable, open-source, paid commercial, or publicly documented customer-facing systems are numerically modeled by default. Private internal orchestration systems are excluded from named numerical claims.
29314
29315 ## Independent and aggregate economic benefit doctrine
29316 Omni-Compass benefit is evaluated as separable labor/capacity, infrastructure, energy/thermal, reliability, software/tooling, and integration surfaces. A labor/capacity benefit may justify deployment independently. A non-labor infrastructure benefit may justify deployment with engineering headcount held constant. Aggregate benefit is permitted only after causal overlap is assigned once and all implementation, residual, security, governance, and operating costs are deducted

```

```

    d. The adopting organization defines the authority envelope and receives no benefit credit for unobserved or unauthorized systems.
29317
29318 ## Private-system pilot bridge
29319 {PM_PRIVATE_SYSTEM_PILOT_DISCLOSURE}
29320
29321 ## No-output-target rule
29322 No manager profile contains a savings percentage, annual savings dollar value, throughput result, latency result, or Omni-Compass outcome. Profiles contain only declared mechanism coefficients, workload applicability, environment fit, operational overhead, engineering complexity, and publicly visible software-free inputs where available. Evaluator-supplied profiles are rejected if they contain result or savings targets.
29323
29324 ## Manager mechanism score
29325 For manager `j`, workload domain `d`, and mechanism axis `a`:
29326
29327  $q[j,d] = \sum_a R[d,a] * M[j,a]$ 
29328
29329 where each requirement row `R[d,*]` sums to one. The estate score is an applicability-weighted workload average.
29330
29331 ## Runtime governance
29332 Manager-alone quality is derived from the manager mechanism score, workload coverage, environment fit, control overhead, mismatch, and fragmentation. Omni-Compass overlay gain is proportional to the unresolved mechanism gap, observed canonical readiness, regulation effort, workload mismatch, and cross-manager fragmentation.
29333
29334 ## Comparator-independent Omni-Compass direct rule
29335 For a fixed canonical run `r`, environment `e`, and normalized scale `N`, the absolute Omni-Compass-direct execution is one mechanism:
29336
29337  $C\_direct(r,e,N | manager=j) = C\_direct(r,e,N)$ 
29338
29339 for every incumbent manager `j`. The same identity is required for throughput, latency, availability, incident loss, energy, staffing, and all other direct metrics. Savings may differ by manager because the incumbent baseline denominator differs:
29340
29341  $Savings\_direct[j] = C\_manager[j] - C\_direct$ 
29342
29343 This corrects the invalid behavior in which the named comparator leaked into the direct mechanism.
29344
29345 ## Matched comparison
29346 For each canonical run, environment, manager, and scale, the disturbance seed excludes execution variant. Manager alone, manager + Omni-Compass, and Omni-Compass direct receive the same demand, utilization noise, failure shock, security exposure, workload vector, and one-stack cost ledger.
29347
29348 ## Financial effect
29349  $Savings[j,v,N] = Cost[j,manager-alone,N] - Cost[j,v,N]$ 
29350
29351  $SavingsPct[j,v,N] = Savings[j,v,N] / Cost[j,manager-alone,N]$ 
29352
29353  $GrossPreTaxProfitUplift = OperatingLossReduction = Savings$ 
29354
29355 before Omni-Compass licensing, implementation, taxes, and company-specific reconciliation. One complete stack is the controlling unit; 10, 100, and 1,000 stacks are exact duplications, so the percentage is invariant across those declared normalized scales for a fixed manager/environment/run population.
29356
29357 ## Declared profile uncertainty study
29358 The fragmentation penalty is a declared assumption equal to PM_FRAGMENTATION_PENALTY_PER_EXTRA_MANAGER = 0.018 per additional selected public manager. The engine publishes a 3,000-draw simultaneous jitter study at  $\pm 5\%$ ,  $\pm 10\%$ ,  $\pm 20\%$ ,  $\pm 30\%$ , and  $\pm 50\%$  over manager/direct mechanism, applicability, environment-fit, control-overhead, and fragmentation assumption, plus a systematic adverse-bias break-even sweep. This is an uncertainty analysis of declared inputs; it is not production telemetry.
29359
29360 ## Acceptance gates
29361 The engine fails the public-manager release if direct absolute outputs vary by incumbent comparator, if matched disturbance identifiers differ across variants, if normalized scale invariance fails, if profile outputs are insufficiently diverse, or if a report-population mean Omni-Compass benefit is negative. Negative values are not clamped or silently rewritten; they stop the benchmark so the mechanism or scope error must be corrected.
29362
29363 ## Claim boundary
29364 The model is executable and falsifiable, but it is not the source code of the named products, a vendor-certified benchmark, a customer invoice, or a production deployment. Evaluators replace mechanism/cost assumptions with product telemetry, configuration, invoices, staffing, incident history, and live matched trials.

29652     # =====
29653     # CANONICAL LOCK RESEAL
29654     #
29655     # The core lock is a table of SHA-256 digests of the locked functions'
29656     # source text. It is authoritative: if a digest does not match, the
29657     # engine refuses to execute.
29658     #
29659     # Previously that table could only be updated by hand. Any legitimate
29660     # edit to the mathematics -- adding the symmetric bistable core, routing
29661     # control through the derivative, removing a state overwrite -- left

```

```

29662 # every dependent digest stale, and the engine would refuse to run for
29663 # ANYONE until each 64-character string was retyped correctly. Ten
29664 # entries were found stale in exactly this way.
29665 #
29666 # `--reseal` recomputes every entry from the current source and rewrites
29667 # the table in place. The lock keeps its full tamper-detection value:
29668 # it still refuses to run on any copy whose mathematics differ from the
29669 # sealed source. Reseal is the deliberate, logged act of an author who
29670 # has intentionally changed the mathematics and is re-declaring it.
29671 #
29672 #     EDIT THE MATH -> python3 <engine>.py --reseal -> RUN
29673 #
29674 # A reseal report is printed and written so every change is visible.

29725     # WHOLE-FILE AUTHENTICITY DIGEST.
29726     #
29727     # OC_AUTHENTIC_SHA256 is a digest of every byte of the engine except
29728     # its own declaration line. Because it lives INSIDE the file it seals,
29729     # any legitimate change to the mathematics permanently flags the build
29730     # "MODIFIED ENGINE - NOT AUTHENTIC", and there was no supported way to
29731     # re-declare it. The author was therefore locked out of their own
29732     # engine by their own seal the moment they improved it.
29733     #
29734     # Reseal now closes that loop. The function-level lock table is written
29735     # first, then the whole-file digest is recomputed over the resulting
29736     # bytes and written last. The digest line is excluded from its own
29737     # hash, so the operation is well defined and converges in one pass.
29738     #
29739     # This does not weaken the seal. A third party who alters the file
29740     # still produces a mismatch against the digest the AUTHOR published.
29741     # Reseal is the author's deliberate act of declaring a new canonical
29742     # release, and it is recorded in the reseal report.

31123     # AUDIT FIX B2 / P3 - EMISSION ORDER AND FAILURE SEMANTICS
31124     # -----
31125     # DEFECT (prior builds): the artifact manifest and the release package were
31126     # sealed HERE, and the minimal proof object, the standalone external
31127     # verifier, the core isolation extract and the replication pack were emitted
31128     # AFTERWARDS. Consequences, all observed in batch e706d5a8-8:
31129     # * RUN_MANIFEST.json contained none of those four artifacts;
31130     # * artifact_count under-reported the directory by two;
31131     # * status="PASS" / missing_expected_artifacts=[] was VACUOUS for exactly
31132     #   the artifacts the report's VERIFICATION PROTOCOL depends on;
31133     # * the engine's own release .zip shipped without the verifier that the
31134     #   report tells the reader to run.
31135     # The comment that used to sit here asserted "deliberately after every
31136     # writer". That invariant was false. It is now true: every writer runs
31137     # above this line.
31138     #
31139     # Failure semantics are also corrected. These four emitters previously
31140     # degraded to a printed [WARN] and allowed the run to publish a report
31141     # asserting artifacts that were never written. Silent degradation is not

4  """CPUFreq contract used by the Omni-Compass hardware ceiling muscle.
5
6  The schedutil *model* and the sysfs *actuator* are deliberately separate:
7
8  * ``schedutil_frequency_invariant()`` is the documented frequency-invariant CFS
9    shape: min(1, 1.25*u), with the 0.8 tipping point.
10 * ``CpuFreqPolicies`` never reimplements schedutil. It only constrains the
11   kernel policy by writing ``scaling_max_freq`` and can restore the exact
12   pre-Omni limits.
13
14 A real run must record the scaling driver/governor. ``intel_pstate`` active
15 mode (including HWP) has different frequency-selection semantics; a ceiling
16 write can still be a real policy bound, but must not be reported as a
17 schedutil-equivalence experiment.
18 """

4  """CPU and GPU on one conserved power budget: the conveyance law (omnicompass/conveyance.py) with CPU organs beside
5  GPU organs, so watts a CPU holds and does not need flow to the GPUs that need them. THEORETICAL SIMULATION on the
6  device physics of hardware/plant.py (GPU gamma fitted to MLPerf v4.0 DGX-H100 MaxQ vs MaxP; CPU first-order DVFS).
7
8  The law, read as mechanism (docs/CONVEYANCE_LAW.md): the site's watts are conserved (moved between organs, never
9  created, Ch. 29 §8); they flow down the gradient of need, from organs holding surplus to organs in deficit (Ch. 31 §4);
10 the flow converges ( $\text{Re}(\lambda) < 0$ , Ch. 31 §5); a reserve for the projected rise is released continuously (Ch. 30).
11 Here the organs are G GPU groups and the G CPU groups that feed them.
12
13 A group = N GPUs and M CPU sockets (two 8-GPU servers: 16 H100-class GPUs, 4 sockets).
14 GPU capacity  $s^\gamma$  at power-limit fraction  $s$ ; power per device  $p_{\text{idle}} + (s p_{\text{max}} - p_{\text{idle}}) u$ 
15 CPU capacity  $f$  at clock fraction  $f$ ; power per socket  $p_{\text{idle}} + (p_{\text{max}} - p_{\text{idle}}) u f^3$ ; clock set by a ceiling
16 ( $\text{cpufreq}$  scaling_max_freq or a RAPL package limit, the hardware connectors in omni_controller/muscles.py)
17 work the GPUs serve requests; each unit of GPU work needs --cpu-share of the CPUs at full clock to feed it:
18 served =  $\min(\text{demand} + \text{backlog}, \text{GPU capacity}, \text{CPU capacity} / \text{cpu-share})$ 
19 site one budget = --budget  $\times$  (sum of GPU TDP + sum of CPU maximum power); a reactive breaker throttles every
20 device uniformly the step after the site draws over it (how a site power capper behaves)
21
22 Arms, same demand, same budget, same breaker:
23 A native: GPUs at TDP, CPUs on their own governor (schedutil-style), only the breaker (it trips: a real
24 power-limited site cannot run this way)
25 S today's practice: every GPU capped at one fixed limit low enough that the site fits even with every CPU at its
26 maximum,  $(\text{budget} - \text{CPU maximum}) / \text{GPU TDP}$ ; CPUs on their own governor
27 XR conveyance among the GPU groups; the CPUs are uncontrolled, so their full maximum power stays reserved
28 (the planning rule when nothing holds the CPUs down); GPU budget = site budget - CPU maximum
29 XM conveyance among the GPU groups; GPU budget = site budget - the CPUs' measured draw, updated every step
30 XC conveyance over CPU and GPU organs together: each CPU group is held to the clock its feeding work needs, and
31 the watts it no longer holds flow to the GPU groups with the largest deficit
32
33 Gauges: work served (GPU work units), backlog minutes (SL0 breach), p95 latency factor, energy, work per kWh,
34 site-budget violation minutes, peak. Usage: python hardware/node_exchange.py [--scenarios 24] [--budget 0.7] [--load 1.

4  """Device plant: CPU frequency (DVFS) and GPU power-limit muscles, three architectures, 24 scenarios.
5
6  SIMULATION. CPU physics use a standard first-order model with declared constants. The GPU performance-vs-power-limit
7  exponent gamma is fitted to real metered hardware: MLPerf Inference v4.0 NVIDIA DGX-H100 MaxQ vs MaxP
8  (results/hardware/CALIBRATION_MLPERF.json, Apache 2.0); the median, least favourable and most favourable fits are all
9  run. Replace with measured curves (RAPL, nvidia-smi) when the hardware connectors in omni_controller/muscles.py run on
10 owned machines.
11
12 Physics (per device, one step = 60 s)
13   CPU   power = P_idle + P_dyn * u * f^3          (dynamic power ~ C V^2 f with V ~ f)
14         capacity = f                             (compute-bound work scales with clock)
15   GPU   power = P_idle + (L - P_idle) * u         (the board draws up to its power limit L when busy)
16         capacity = (L / TDP)^gamma               (concave performance-vs-power-limit curve, gamma per workload)
17   Queue backlog += demand - served; SLO breach when backlog exceeds one step of demand.
18   Heat thermal = 0.86 thermal + 0.14 (0.34 + 0.62 power_stress) (the harness heat law)
19
20 Architectures (the only difference between arms is who sets f or L)
21   A native   CPU: schedutil-style governor f = min(1, 1.25 u_needed); GPU: power limit = TDP (vendor default)
22   B on top    the native governor runs, Omni-Compass sets a ceiling: f = min(native f, cap); L = cap x TDP
23   C direct    Omni-Compass replaces the native governor. CPU: f = min(cap, want / rho*), rho* the engine's target
24               utilisation (its demand output), floor f_min; GPU: L = cap x TDP (floor f_min)
25   S reference a fixed manual cap at 70% (f or L), no Omni-Compass: what an operator could do by hand
26 Omni-Compass = the shipped Governor (fleet law); its power_cap output is the cap.

4  """Site power exchange: G GPU groups share one site power budget (power oversubscription: the budget is below the sum
5  of TDPs). THEORETICAL SIMULATION on the device physics of hardware/plant.py (MLPerf-calibrated gamma).
6
7  Each group has its own demand (different traffic shapes and phases). Settings are GPU power-limit fractions s; group
8  capacity = n s^gamma; power per device = p_idle + (s p_max - p_idle) u.
9
10 Arms, all under the same site budget, all with the same site breaker (if a step's site power exceeds the budget, the
11 next step every group is throttled uniformly to fit, which is how a reactive site capper behaves):
12   A native: every GPU at TDP; only the reactive site capper
13   S static split: every group gets budget / G (the common manual practice)
14   I independent: each group sized by the device law (want / rho)^(1/gamma) on its own, no exchange
15   X conveyance: the conserved-budget replicator flow of omnicompass/conveyance.py moves watts between groups toward
16   need, holds a reserve for projected rises, releases it continuously (manuscript Ch. 29-31)
17
18 Gauges: work served, backlog (SLO breach) minutes, p95 latency factor, energy, site-budget violation minutes, peak.
19 Usage: python hardware/site_exchange.py [--scenarios 24] [--seed 818181] [--budget 0.7]"""

4  """Mechanism harness: recorded metrics-server-shaped series → HPA + Omni engine.
5
6  This is the strongest test of Omni's *mechanism* that does not require a cluster.
7
8  Scored:
9      M1 Primary HPA vs filled status.desiredReplicas (independent HPA v2)
10     M2 Omni observe leaves the HPA replica path identical
11     M3 Engine state stays finite on every sample
12     M4 |u| <= U_AUTHORITY when the push law is evaluated
13     M5 S stays above S_minus of the stack params (Prop. 1 on the evolved state)
14     M6 Shield I1-I5 on the directive converted to actions
15     M7 C++ governor matches Python on the same observation stream
16 """

4  """Multi-workload fleet benchmark at 15-second resolution.
5
6  Baselines: HPA (targets 0.5, 0.7, 0.8) + Cluster Autoscaler; HPA 0.7 + Karpenter-lite; HPA 0.7 + Karpenter-lite + VPA-l
   ite.
7  Omni-Compass arms (governor evaluated every 60 s on fleet telemetry; equation (2) push computed on the evolved state):
8  omni_observe      governor computes, HPA 0.7 + Cluster Autoscaler act (must equal hpa70_ca)
9  omni_target_ca    governor writes the HPA target (rho*); Cluster Autoscaler unchanged
10 omni_full         single authority: HPA target, request sizing (workloads at minimum replicas only, so the HPA does
11                  not compensate), provisioning, consolidation and node power caps
12 omni_full_*       ablations: no_gate, no_dynamics, no_power, no_requests
13 Every omni_full action passes the fleet shield:
14 F1 no consolidation while pods are pending or backlog exceeds shield_backlog of capacity
15 F2 no consolidation of a node younger than 5 minutes, or whose pods do not fit on the remaining nodes
16 F3 no power-cap tightening in an interval in which capacity is provisioned; caps in [cap_min, 1]
17 """

4  """Kubernetes autoscaling controllers (documented behaviour) and the Omni-Compass bridge for the fleet plant.
5
6  HPA (kubernetes.io, Horizontal Pod Autoscaling): desired = ceil(current * utilization / target); no change while
7  |ratio - 1| <= 0.1; scale-down uses the highest recommendation of the last 300 s; scale-up limited to
8  max(4 pods, 100%) per 15 s. Utilization is read from the previous tick (metrics-server scrape lag).
9  Cluster Autoscaler (kubernetes/autoscaler FAQ): scale-up for unschedulable pods (boot 180 s); a node whose requested
10 CPU is below 50% of allocatable for 10 minutes, whose pods fit elsewhere, and which is not within 10 minutes of a
11 scale-up, is removed (one per scan).
12 Karpenter-lite: provisioning for unschedulable pods (boot 60 s); every 60 s, one node older than 5 minutes whose pods
13 fit on the remaining nodes is consolidated.
14 Coordinated request sizing (Omni): as VPA-lite, restricted to workloads at minimum replicas, and never below
15 p99 per-pod usage / (0.9 x HPA target), so that the resized request cannot move the HPA outside its tolerance band.
16 VPA-lite: every 30 minutes, request = 1.15 x p90 of per-pod usage over the elapsed window, applied when it differs
17 by more than 10% (the Kubernetes documentation advises against combining HPA and VPA on CPU; the arm is included
18 as an aggressive request right-sizing baseline).

4  """Problem map 13: runaway AI agents (loops, recursive spawning, overnight five-figure bills; Dark Reading).
5
6  Plant (1-minute steps, 24 hours; 40 agents)
7  every agent does work: tool/model calls that cost money, sub-agent spawns, outbound calls; honest agents have
8  their own rhythm and legitimate bursts (a big task can run at 3-6x its usual rate for 10-60 minutes)
9  rogue onsets (random agent, random time):
10     loop      spend rate jumps 10-40x (retry / self-call loop)
11     fork      spawns sub-agents that each spend and spawn (doubling)
12     exfil     calls to non-allow-listed destinations
13     escalate  attempts at forbidden APIs (secrets, cluster-admin)
14  enforcement layers common to every arm: RBAC denies forbidden APIs and a NetworkPolicy blocks non-allow-listed
15  egress (both blocked at the source); attempts are still observable
16  Arms
17  native_static  per-agent daily budget cap ($150) and a quota of 20 sub-agents: stops an agent when a cap is hit
18  native_tight   the same with caps sized to stop runaways early ($40, 5 sub-agents): the operator's other choice
19  omni           one engine per agent; observes spend rate against the agent's own baseline (queue), spawn rate
20                (load), denied attempts (security_block), rate change (drift); actions: throttle (halve the
21                agent's rate) when the engine's integrated need I_U or E rises; contain (freeze + revoke + audit)
22                when a denied attempt is seen or pressure persists past the dwell; release throttle when calm
23  omni_no_engine same mapping, engine not evolved
24  Gauges: rogue overspend ($ spent by rogue agents after onset), time to contain (minutes), peak sub-agents, honest
25  agents stopped (false stops), honest work completed (%), forbidden actions executed (always 0: RBAC), audit lines.

4  """Problem map 6: GPU utilisation ~5% and idle GPUs scattered across nodes (volcano #3948, kueue #5243).
5
6  Plant (1-minute steps, 2 days)
7      16 nodes x 8 GPUs; a node can be powered off (5-minute boot); node base 1.0 kW, GPU 0.10 kW idle / 0.70 kW busy
8      jobs arrive (diurnal Poisson) asking for 1, 2, 4 or 8 GPUs on ONE node, run 20 min - 12 h, checkpoint every 30 min
9      fragmentation: a job waits although enough GPUs are free in total, because no single node has them
10 Arms
11     native_spread      kube-scheduler default (LeastAllocated: node with most free GPUs); Cluster Autoscaler
12                        (power a node on for pending jobs, off after 10 minutes empty)
13     native_binpack     Volcano / KAI binpack (MostAllocated: fullest node that fits); same autoscaler
14     omni                binpack placement; defragmentation: when a job is blocked only by fragmentation, the engine may
15                        move small jobs at their next checkpoint (3-minute pause each) to free a whole node; nodes powered
16                        off when empty only while the engine's push reports convergence, powered on ahead when the engine's
17                        integrated need I_U rises; engine observes queue, load and fragmentation (drift)
18     omni_no_engine     same mapping, engine not evolved

8      pods n with CPU request r (cores) and memory request M (GiB); capacity = n * r (a pod can use its request)
9      response time: M/M/c with c = n, u = d / (n r), service time 50 ms; unserved work queues (backlog)
10     OOM kill when a pod's memory need exceeds M (pod restarts: lost for 1 minute, its work queues)
11     cost = requested core-hours and requested GiB-hours (what the scheduler reserves, what nodes are bought for)
12 Arms
13     native_hpa          HPA on CPU at 70% of request, static requests from the deployment (r0, M0) as most teams run
14     native_hpa_vpa      HPA on CPU 70% + VPA (in-place mode, no restarts; the strongest VPA) every 5 minutes setting
15                         r = 1.15 x p90 per-pod CPU and M = 1.15 x p90 per-pod memory over the last 8 hours:
16                         the combination the Kubernetes project warns against (autoscaler #6247)
17     native_turbonomic   Turbonomic-style container resize every 10 minutes to p99 per-pod usage (aggressiveness p99),
18                         HPA 70% left in place
19     omni                one authority for replicas AND requests: the engine evolves on (queue, load, drift, memory
20                         pressure); total CPU = d / rho* (rho* the engine's target), split into pods of the size the
21                         service prefers; memory M = peak need over the last hour x (1 + margin), margin grown by the
22                         engine's stress E; scale-in only while the engine's push reports convergence
23     omni_no_engine      same mapping, engine not evolved

4  """Problem map 11: energy measurement inside VMs is impossible (no RAPL/IPMI in guests; kepler #2487).
5
6  This muscle is on the sensing side (afferent): how well each VM's energy is attributed, so savings can be proven.
7  Plant (10-second steps, 6 hours): a host with a real meter (RAPL/IPMI at the host) runs 8 VMs. True per-VM power
8  = share of host idle (by vCPU count) + dynamic power that depends on CPU time AND on what the CPU is doing:
9  memory-bound work draws less per busy second, vector (AVX) work more, and turbo raises power per unit of work
10 when the host is lightly loaded. Only CPU time per VM is visible to the estimator (as in Kepler).
11 Arms
12 native_kepler    Kepler-style model: fixed power per CPU-second trained on another machine, idle split by vCPUs
13 native_ratio     host meter split by CPU-time share (uses the host meter, ignores workload type)
14 omni             host meter + per-VM coefficients learned online (recursive least squares on the constraint that
15                 VM powers sum to the host meter), with the engine's drift observation (meter residual) raising the
16                 learning rate when the attribution goes stale
17 omni_no_engine   same estimator, engine not evolved
18 Gauges: attribution error (mean absolute % per VM), worst VM error, total error vs the meter.

4  """Score a pilot from your own cluster captures (fleet/capture/kube_capture.sh schema).
5
6  Compare a baseline capture (your normal autoscaling: a period before Omni-Compass, or a matched node pool) with an
7  Omni-Compass capture (a period or matched pool under the controller). Because traffic differs between periods and
8  pools, efficiency is normalised by the work actually done (CPU core-hours used):
9
10     node-hours per used core-hour          lower is better
11     energy per used core-hour (kWh)        lower is better; measured from power_w if captured, otherwise modelled
12                                           from --idle-w / --dyn-w per node and utilisation
13     mean CPU utilisation (used / allocatable) higher is better
14     pending-pod minutes per hour           service proxy, lower is better
15     HPA shortfall minutes per hour         minutes with desired replicas above current replicas, lower is better
16
17     Each capture is cut into blocks (default 60 minutes). Differences between the Omni-Compass and baseline block means are
18     given with a bootstrap 95% interval over blocks; a verdict is stated only when the interval excludes zero.
19
20     python pilot/score.py --baseline baseline.csv --omni omni.csv [--idle-w 200 --dyn-w 350] [--block-minutes 60] [--out sc

4  """End-to-end self-pilot: the shipped controller (omni_controller), capture schema (kube_capture.sh) and scorer
5  (pilot/score.py) run together against a simulated cluster, exactly as a user would run them against a real one.
6
7  The simulated cluster answers the controller's kubectl reads (nodes, pods, kubectl top, HPAs) from a 15-second plant
8  (fleet/harness.py workloads, request packing, node boot delay, power), applies its HPA patches, and applies node-pool
9  resizes issued through --node-scale-cmd. Baseline day: HPA at its configured target with the Cluster Autoscaler.
10 Omni-Compass day: the same traffic, controller in nodepool mode, Cluster Autoscaler off. Both days are captured every
11 15 s in the kube_capture.sh schema and scored with pilot/score.py using the plant's power. Simulation, not a real clust
er.

846 OC_FULL_LICENSE_TEXT = ""OMNI-COMPASS REFEREE ENGINE
847 SOURCE-AVAILABLE EVALUATION LICENSE
848 Version 1.0
849
850 Copyright (c) 2026 The Omni-Compass LLC. All rights reserved.
851 Creator / Developer of record: AJ Dubra.
852 Owner of record: The Omni-Compass LLC, a Delaware limited liability company.
853
854 THIS IS NOT AN OPEN SOURCE LICENSE. The source code is published so that it
855 can be read, audited, executed and independently verified. It is not published
856 for redistribution, for incorporation into other products, or for production
857 use.
858
859 1. DEFINITIONS
860
861 "Software" means the Omni-Compass Referee Engine source file(s) distributed
862 under this License, together with accompanying verification tooling and
863 documentation.
864
865 "Authentic Release" means a copy of the Software that is byte-identical to
866 a release published by the Licensor at the Official Source, as confirmed by
867 the published canonical SHA-256 digest for that release.
868
869 "Official Source" means https://www.omni-compass.com.
870
871 "Modified Copy" means any copy of the Software that is not an Authentic
872 Release, regardless of how small the difference is.
873
874 "Marks" means the names "Omni-Compass", "Omni-Compass", "Omni-Compass Referee
875 Engine", and any associated logos or product names of the Licensor.
876

```

```
877
878 2. GRANT
879
880 Subject to every condition below, the Licensor grants you a worldwide,
881 royalty-free, non-exclusive, non-transferable, revocable license to:
882
883 (a) download and retain a copy of the Software;
884 (b) read, study, review and analyze the source code;
885 (c) execute the Software for the purposes of evaluation, verification,
886 replication, benchmarking, academic study and internal assessment; and
887 (d) publish the results of that evaluation, including results that are
888 critical of the Software, provided you comply with Section 5.
889
890 You may run the Software as many times as you wish, with any seed, and
891 publish the resulting reports.
892
893
894 3. RESTRICTIONS
895
896 You may NOT:
897
898 (a) redistribute, republish, mirror, resell, sublicense or otherwise convey
899 the Software or any part of it to any third party. Direct others to the
900 Official Source instead;
901
902 (b) publish, distribute or make available any Modified Copy;
903
904 (c) use the Software in production, or as a component of any product or
905 service offered to third parties, without a separate written commercial
906 license from the Licensor;
907
908 (d) remove, disable, bypass, obscure or alter the authenticity self-check,
909 the integrity digest, the authenticity banner, the provenance block, or
910 any attribution or copyright notice contained in the Software;
911
912 (e) misrepresent the origin, authorship, provenance or authenticity of the
913 Software or of any output it produces.
914
915
916 4. MODIFICATION AND MANDATORY RENAMING
917
918 You may modify your own copy of the Software for private study and testing.
919
920 If you make any modification, then that copy is a Modified Copy and:
921
922 (a) it MUST NOT be called Omni-Compass, Omni-Compass Referee Engine, or any
923 name confusingly similar to the Marks;
924
925 (b) it MUST NOT display, print, embed or otherwise present any of the Marks
926 in its output, documentation, interface, filenames or metadata;
927
928 (c) it MUST carry a clear notice, at the top of the source file and in all
929 output it produces, stating that it is a modified derivative and is NOT
930 the Omni-Compass Referee Engine;
931
932 (d) it MUST retain and MUST NOT alter the authenticity self-check, so that
933 the modification remains detectable; and
934
935 (e) its output MUST NOT be presented, described, cited, published or
936 implied to be Omni-Compass results, Omni-Compass performance, or evidence
937 about the behavior, correctness or capability of Omni-Compass.
938
939 This condition follows long-established practice for reference
940 implementations, most notably Donald Knuth's condition on TeX: a program
941 that has been changed may not carry the original name.
942
943
944 5. TRUTHFUL ATTRIBUTION OF RESULTS
945
946 You are free to publish results, including negative results, criticism,
947 benchmarks and failure reports. That freedom is deliberate. The Licensor
948 invites scrutiny.
949
950 You must, however, when publishing any result attributed to the Software:
951
952 (a) state the canonical SHA-256 digest of the exact file you executed;
953 (b) state the Python version and the versions of all dependencies used, or
954 state the digest of the published container image if one was used; and
955 (c) state the seed and any command-line arguments used.
956
957 Publishing output as Omni-Compass results when it was produced by a Modified
```

```

958     Copy, or by an unstated or altered environment, is a breach of this License
959     and may additionally constitute trademark infringement, false designation
960     of origin, and commercial disparagement.
961
962
963 6. TRADEMARKS
964
965     The Marks are the property of the Licensor and are NOT licensed under this
966     License. No right to use the Marks is granted except the limited right to
967     refer to the Software accurately and descriptively, in the manner of
968     ordinary nominative fair use, when reporting Authentic Release results.
969
970
971 7. NO WARRANTY
972
973     THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR
974     IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY,
975     FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT.
976
977
978 8. LIMITATION OF LIABILITY
979
980     IN NO EVENT SHALL THE LICENSOR BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER
981     LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING
982     FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER
983     DEALINGS IN THE SOFTWARE.
984
985
986 9. TERMINATION
987
988     This License terminates automatically and immediately if you breach any of
989     its terms. On termination you must destroy all copies of the Software in
990     your possession. Sections 4, 5, 6, 7 and 8 survive termination.
991
992
993 10. GOVERNING LAW
994
995     This License is governed by the laws of the State of Delaware, United States of America, without
996     regard to its conflict of law provisions.
997
998

3396     EXECUTION_CONTRACT (RUNTIME ATTESTATION)
3397     -----
3398     This console output and all generated artifacts are emitted directly by
3399     a live Python execution of this script.
3400
3401     The reported results are the exclusive consequence of:
3402     • the declared program logic
3403     • the runtime configuration snapshot
3404     • the sampled parameters drawn within declared ranges
3405     • the RNG state used during this execution
3406
3407     No paraphrase, substitution, omission, or post-processing is performed
3408     by the engine when emitting its own reports and artifacts.
3409
3410     PARAMETER FIXITY + TUNABILITY NOTICE
3411     -----
3412     This run uses a fixed configuration snapshot (printed below) and sampled
3413     parameters drawn within declared ranges.
3414
3415     These results are not absolute or maximal. A reviewer may strengthen,
3416     weaken, accelerate, delay, or reshape basin capture and stability behavior
3417     by adjusting configuration knobs and/or parameter ranges (e.g., basin_tol,
3418     stability_window, macro_steps/cutoff, dt/micro_steps, forcing/coupling).
