```

12777     meta = meta or {}
12778     snap = _oc_economic_benefit_model_snapshot(meta)
12779     lines = [
12780         "PRIMARY STACKS / CLUSTERS HEALTH PRINCIPLE: Omni-Compass value begins with the operating health of governed ST
ACKS / CLUSTERS and authorized connected products, not with a staffing assumption. The governing core maintains shared
state, evaluates admissibility, arbitrates conflicting local decisions, applies bounded correction, and retains an acqui
red operating basin so the controlled estate can spend less time oscillating, reconciling, retrying, over-scaling, rec
overing, or operating outside its declared admissible condition.",
12781         "PROACTIVE GOVERNING MECHANISM: The mechanism is designed to act on the shared governing state while deviation
is developing, subject to the authorized control envelope, rather than depending exclusively on fragmented downstream m
anagers reacting after independent thresholds have already been crossed. The intended benefits are shorter deviation du
ration, fewer repeated corrections, coordinated recovery, and lower avoidable operating stress. Production claims requi
re matched telemetry and environment-specific validation.",
12782         "CPU / GPU / ACCELERATOR BENEFIT SURFACE: The integrated compute benchmark measures completed work together wit
h powered CPU core-hours, powered GPU-hours, facility energy, peak power, queue delay, SLA behavior, makespan, and ther
mal excursions. Lower powered resource-hours at equal completed work can reduce computational energy demand and the dur
ation for which processors and accelerators remain electrically active.",
12783         "PRODUCT / HARDWARE PRESERVATION SURFACE: Verified reductions in powered work, peak demand, thermal exposure, r
etries, oscillatory control, unnecessary state changes, or recovery cycles can reduce stress imposed on CPUs, GPUs, acc
elerators, batteries, converters, power electronics, cooling systems, motors, robotics, edge devices, servers, storage
systems, and other authorized hardware. Longer life, lower wear, maintenance reduction, battery-life extension, or repl
acement deferral are validation targets, not automatic conclusions, and require device-specific longitudinal evidence."
    ]
12784     "ENERGY / THERMAL / COOLING SURFACE: Electrical work ultimately becomes heat. The report therefore traces compl
eted useful work -> powered resource-hours -> electrical demand -> peak power -> thermal exposure -> cooling burden. Th
is supplies a testable pathway from governing coherence to lower energy and heat-loading pressure without relabeling so
ftware disorder as thermodynamic entropy.",
12785     "RELIABILITY / PREVENTION / CONTAINMENT / RECOVERY SURFACE: The enterprise and STACKS / CLUSTERS benchmarks mea
sure failures, material outages, security incidents, availability, dropped work, recovery, incident severity, and relat
ed loss surfaces under matched disturbances. Governance changes prevention, coordination, containment, and recovery whi
le the common disturbance draw remains matched across comparison modes.",
12786     "SPEED / RESPONSE SURFACE: Piece I line (4) contains the bounded effective governing-drive term  $v_{eff} = \chi(t)c$ 
 $\tanh(\dots)$ , where  $c$  is the declared limiting-velocity parameter. Because  $|\tanh(\cdot)| < 1$  and  $|\chi(t)| \leq 1$ ,  $|v_{eff}| \leq c$ . The e
ngine may therefore report normalized near-limit  $v_{eff}/c$  behavior and executed convergence, event-time, reaction-time,
latency, and throughput metrics. This is a computational governing-response statement; it is not a claim that physical
information, packets, or signals were measured at 0.99 times the vacuum speed of light.",
12787     "MEMORY / NETWORK / STORAGE SURFACE: Reduced replication churn, queueing, rework, cache reload, duplicate contr
ol actions, cross-system reconciliation, and unnecessary movement can reduce memory traffic, network transfer, egress,
storage I/O, write amplification, and transfer latency per completed unit of useful work.",
12788     "DIRECT-MUSCLE / PHYSICAL-SYSTEM SURFACE: The same canonical governing state may be connected, through domain-s
pecific adapters and safety contracts, above managers, between managers and actuators, or directly to operational muscl
es. The current enterprise suite includes synthetic direct-actuator evaluations across motor, thermal, network, and pow
er-grid plant families; the architecture additionally maps robotic, aerospace, vehicle, optimizer, estimator, and other
bounded control interfaces without claiming universal superiority over specialized local controllers.",
12789     "CROSS-DOMAIN MARKET SURFACE: The source catalog spans executable or mapped families including compute, contain
ers, network, storage, data, observability, security, automation, AI, scientific/HPC, robotics, automotive, aerospace,
enterprise, logistics, edge/IoT, resilience, and governance. The common market benefit is not identical physics in ever
y industry; it is a common supervisory function: shared state, admissibility, conflict arbitration, bounded correction,
persistence, recovery coordination, and auditable authority across heterogeneous managers and muscles.",
12790     "SCIENTIFIC / HPC SURFACE: The declared muscle catalog includes scientific HPC, astrophysics/mission analysis,
and multidisciplinary optimization. Potential benefits include coordinated scheduling, resource placement, reduced queu
e and retry burden, accelerator utilization, reproducible decision replay, bounded recovery, and lower energy per compl
eted scientific workload, subject to workload-specific validation.",
12791     "AI / OPTIMIZATION SURFACE: AI inference/training resources, Adam-style optimizers, schedulers, and heterogeneo
us accelerators are represented as governed or mapped muscles. The supervisory value proposition is cross-layer coordin
ation of resource, policy, safety, and recovery decisions; the report does not claim to replace the specialized learnin
g or optimization mathematics itself.",
12792     "ROBOTICS / AUTOMOTIVE / AEROSPACE SURFACE: ROS 2 graphs, industrial robotics, autonomous-vehicle perception/pl
anning/control, flight control, propulsion/thermal workloads, satellite telemetry/command, motors, and other actuators
are mapped as domain surfaces. Benefits to be tested include bounded command arbitration, coordinated fault response, e
nergy/thermal management, reduced conflicting control, recovery behavior, and product-hardware preservation under domai
n safety constraints.",
12793     "EDGE / IoT / REMOTE-SYSTEM SURFACE: Edge fabrics and intermittent-link environments can benefit from shared st
ate, bounded local authority, fallback, recovery, reduced duplicated coordination, and explicit partition/latency handl
ing. Actual distributed-scale capability remains constrained by telemetry throughput, fan-in, latency, redundancy, part
itioning, and compute capacity.",
12794     "SECURITY / GOVERNANCE / AUDIT SURFACE: The architecture exposes least-privilege authority modes, command rejec
tion, override, rollback, kill switch, fallback, decision replay, provenance, telemetry consensus, and audit surfaces.

n is claimed.",
12795     "STACK-TAX ACCOUNTING PRINCIPLE: STACKS / CLUSTERS tax is the financial translation of avoidable fragmentation
burden after the technical surfaces are measured. It may include compute, accelerator, memory, network, storage, power,
cooling, incidents, recovery, tooling, integration, maintenance, facilities, support, and any independently verified s
upervisory operating cost. The customer decides where verified dollars belong in its ledger; no workforce reduction is
presumed or promoted.",
12796     "AGGREGATE-BENEFIT PRINCIPLE: Verified benefit surfaces may be combined only after causal overlap is assigned o
nce. Gross benefit is not net benefit until implementation, migration, training, security, residual-license, governance
, transition, ongoing operating cost, and quantified risk are deducted.",
12797     "CLAIM BOUNDARY: Canonical trajectories and numerical checks are executed computational records; compute, manag
er, enterprise, public-manager, and Megastack surfaces are executed synthetic or digital-twin evidence unless a report
explicitly identifies physical telemetry. Physical lifetime, battery endurance, maintenance, customer savings, safety c

```

13583         "The governing distinction is architectural: Omni-Compass may govern managers, govern muscles through managers,
govern managers and muscles together, or govern muscles directly. The selected deployment level is an engineering choi
ce; the canonical mathematical core remains the same while adapters, constraints, permissions, and safety contracts cha
nge by domain.",
13584         f"The law is stack-count agnostic at the mathematical level: local weakness, excess, conflict, or drift is repr
esented through the common state and returned as a bounded coordinated directive. Operational scale is nevertheless con
strained by telemetry throughput, state aggregation, adapter fan-in, latency, partitioning, redundancy, and compute cap
acity. Million-stack operation is an owner scalability objective requiring distributed implementation and scale certifi
cation; it is not represented as measured by the present {summary.get('total', 0)}-run canonical campaign.",
13585         "The intended governing effect is system-wide coherence redistribution: under-responsive modules receive increa
sed corrective authority, over-responsive modules are damped or rebalanced, and conflicting manager or muscle proposals
are reconciled against the same admissibility and basin-retention contract.",

16717
16718         for _ln in """Runtime Binding & Outcome Dependence
16719
16720 This section records the complete numeric parameter configuration under which the Omni-Compass Unified Governing Conver-
16721 gence Control Core Engine was executed for the Monte Carlo batch reported herein.
16722
16723 The canonical governing equation, state topology, saturation law, basin-directed correction, dwell criteria, and retain-
16724 ed-basin regulation define the mechanism. The parameter values listed above instantiate the quantitative operating poin-
16725 t used in this run.
16726
16727 Parameters tune rate, force, damping, transient shape, capture interval, control effort, and operating smoothness. They
16728 may accelerate, delay, strengthen, soften, or reshape conveyance while the governing mechanism remains structurally un-
16729 changed.
16730
16731 All numerical results, classifications, metrics, figures, and artifacts in this execution are direct consequences of th-
16732 e recorded parameter values, initial conditions, wiring, seed, horizon, and configuration. Alternative parameterization
16733 s require their own execution record and may produce different quantitative trajectories.
16734
16735 The Omni-Compass mathematical position is mechanism-dominant and parameter-flexible: conveyance is generated by the can-
16736 onical topology rather than by one privileged parameter tuple, provided the signs, bounds, admissibility conditions, nu-
16737 merical stability, and integration wiring remain valid. Values that violate those conditions are not equivalent admissi-
16738 ble implementations.
16739
16740 Accordingly, this report binds its measured numbers to the disclosed configuration while preserving the separate declar-
16741 ed position that multiple admissible parameter sets can achieve conveyance at different speeds, strengths, and interval
16742 s.""".split("\n\n"):

16945
16946
16947         _APPENDED_12_22_TEXT = r"""12. SENSITIVITY / DRIVER SUMMARY
16948 -----
16949
16950 This subsection ranks the strongest measured drivers observed during the run,
16951 based on the emitted draws and the executed configuration snapshot.
16952
16953 Reported items include:
16954 • Parameter key / driver name
16955 • corr_steps (correlation vs. steps-to-convey / convergence step behavior)
16956 • corr_rms (correlation vs. RMS behavior)
16957 • sample count (n) used in the correlation estimate
16958
16959 If the run emits insufficient history to compute RMS and/or sensitivity
16960 correlations, the engine will state that directly for this execution.
16961
16962 13. OBSERVED BEHAVIORS, REGIMES & EMERGENT DYNAMICS
16963 -----
16964
16965 This section is restricted to classifications actually present in the current
16966 raw run rows. The authoritative counts are the Section 9 regime table, the
16967 U_history records, the basin-entry and dwell fields, and the machine-readable
16968 CSV/JSONL artifacts. No unobserved category is listed as though it occurred.
16969
16970 The engine distinguishes uncontrolled continuous-flow behavior from the bounded
16971 derivative-level control contribution. A trajectory may be described as
16972 monotone or oscillatory only when that label is computed from its recorded
16973 U_history. Divergence, switching, late migration, noise response, and other
16974 behaviors are reported only when their corresponding executed fields or
16975 dedicated evidence-suite records are nonzero. Conceptual possibilities are
16976 not promoted to current-run observations.
16977

```

```
16978 14. PURPOSE
16979 -----
16980
16981 The Omni-Compass Unified Governing Convergence Control Core Engine is designed to
16982
16983 UNIFIES TERMINOLOGY CLARIFICATION
16984
16985 The term 'unifies' refers to basin capture and retained-state behavior produced by the complete hybrid mechanism: continuous Piece I flow followed by the declared microstep P_sigma regulation/projection. It does not mean report-time alteration, deleted failures, artificial early termination, or post-execution coercion of recorded trajectories.
16986
16987     execute large-scale
16988 Monte Carlo simulations of the canonical eight-line Piece I continuous flow
16989 combined with the explicit bounded zero-order-held RK4 microstep operator in order to
16990 characterize basin capture, conveyance, certification, regulation effort, bath
16991 residual consistency, and full-horizon behavior under controlled parameter
16992 sampling.
16993
16994 The engine functions as a trajectory-based unification and measurement system.
16995 It is not a symbolic solver and does not assert closed-form analytical
16996 solutions.
16997
16998 Each Monte Carlo run represents one independent trajectory governed by the
16999 same complete hybrid operator, symbol set, classification rules, and execution
17000 logic, with variation arising from sampled initial conditions and runtime
17001 parameters.
17002
17003 The purpose of this execution is to measure, validate, and demonstrate the
17004 behavioral properties of the Omni-Compass Unified Governing Convergence Control Core Engine as a
17005 core infrastructural system under the declared configuration.
17006
17007 15. SCOPE
17008
17009 PARAMETER SAMPLING DISCLOSURE
17010
17011 Unless explicitly declared as fixed, runtime parameters are sampled independently using uniform distributions over their declared bounds. No adaptive resampling or post-hoc parameter adjustment is performed.
17012
17013 -----
17014
17015 This execution evaluates a fixed governing equation and symbol table under
17016 a declared runtime configuration and parameter ranges. Each Monte Carlo run
17017 represents one independent trajectory with sampled initial conditions and
17018 parameters.
17019
17020 Outputs include:
17021 • Aggregate statistical summaries
17022 • Stability and conveyance classifications
17023 • Representative raw trajectory disclosures
17024 • Full machine-readable datasets (CSV / JSONL)
17025 • Human-auditable PDF reports
17026
17027 SYMBOL SCOPE CLARIFICATION
17028
17029 The Omni-Compass symbol chart defines the full conceptual framework of the system. This execution evaluates a single declared governing equation and runtime configuration within that broader symbol space.
17030
17031 The scope of interpretation is strictly limited to the executed configuration,
17032 parameter ranges, and stability rules embedded in this run. No claims beyond
17033 this execution context are implied.
17034
17035 16. ENGINE BEHAVIOR, METHODOLOGY & PROTOCOL
17036 -----
17037
17038 This section defines the execution methodology and operational protocol used by the Omni-Compass Unified Governing Convergence Control Core Engine during runtime. The engine is an empirical Monte Carlo trajectory executor. It performs direct time-stepped simulation of the canonical governing equation under a declared runtime configuration and parameter sampling procedure.
17039
17040 METHODOLOGY (AS EXECUTED)
17041
17042 RANDOMNESS & STOCHASTIC SAMPLING DISCLOSURE
17043
17044 All stochastic sampling and noise injection in this execution are generated using Python's standard pseudorandom number generator. Random seeds are initialized per batch execution. Given identical code, configuration, and seed state, this engine is designed to reproduce identical classification outcomes within numerical precision limits.
17045
17046
17047 1) Initialization
17048 Each trajectory run is initialized by:
17049 • Sampling or assigning initial conditions for all state variables referenced by the governing equation
```

17050 • Sampling or assigning runtime parameters within declared bounds
 17051 • Applying any declared schedules, caps, saturation limits, and clamps prior to stepping
 17052 • Establishing run identifiers, seed state, and reproducibility metadata
 17053
 17054 2) Time-Stepped Integration
 17055 Each trajectory evolves via discrete stepping across a fixed step horizon. At each step the engine:
 17056 • Evaluates forcing inputs and noise terms as configured
 17057 • Computes state increments implied by the governing equation
 17058 • Applies saturation behavior (e.g., tanh-based limiting) as defined
 17059 • Applies clipping, bounds enforcement, and numeric safety constraints as configured
 17060 • Records step history for classification, RMS, and diagnostics
 17061
 17062 3) Stability and Conveyance Evaluation
 17063 STABILITY CRITERIA DISCLOSURE
 17064
 17065 Stability and conveyance are defined operationally by the criteria implemented in this engine, including windowed convergence tests, tolerances, and RMS thresholds. Alternative stability definitions may yield different classification outcomes.
 17066
 17067 During stepping, the engine evaluates stability and conveyance according to the embedded criteria. These criteria may include:
 17068 • Basin capture / basin center proximity checks
 17069 • Windowed stability checks across a declared stability window
 17070 • Threshold checks (tolerances, bands, and RMS criteria)
 17071 • Rescue logic (if defined) to detect and mediate transient divergence.
 17072 A trajectory is classified immediately upon meeting the declared stability or termination conditions, without requiring completion of the full step horizon unless required by configuration.
 17073
 17074 4) Classification Protocol
 17075 Each run is assigned exactly one outcome classification. Canonical outcome categories include, but are not limited to:
 17076 • Conveyed (stable basin capture achieved under criteria)
 17077 • Unconveyable (no stable capture within step horizon)
 17078 • Born in Basin (stable at initialization under criteria)
 17079 • Rescued (stability achieved via rescue-mediated convergence).
 17080 Additional regime labels may be assigned based on observed convergence mode, including monotonic or oscillatory convergence behaviors, as defined by the execution logic. No trajectory is left undefined. No trajectory is dropped.
 17081
 17082 5) Ensemble Aggregation
 17083 After all trajectories execute, the engine computes aggregate statistics and diagnostics, including:
 17084 • Total run counts and category counts
 17085 • Conveyance and unconveyance rates
 17086 • Steps-to-conveyance summary statistics
 17087 • Stability mode breakdowns
 17088 • RMS metrics and robustness summaries (if enabled)
 17089 • Sensitivity / driver correlations (if enabled)
 17090
 17091 PROTOCOL (OUTPUTS AND TRACEABILITY)
 17092 All outputs are generated programmatically from executed runtime data. The engine produces:
 17093 • Console executive summary (human-readable)
 17094 • Report sections populated from computed results
 17095 • Visual distributions and plots (when enabled)
 17096 • Machine-readable datasets (CSV / JSONL) where configured
 17097 • Run identifiers and configuration hashes for traceability.
 17098 All reported values correspond to executed configuration and recorded run data. No manual edits, symbolic reduction, or post-processing is applied to reported results.
 17099
 17100 FAILURE MODES AND SAFETY CONTROLS
 17101 The engine enforces numeric and execution safeguards, which may include:
 17102 • Detection of divergence or runaway values
 17103 • Clipping and saturation enforcement
 17104 • Bounds adherence checks for sampled parameters
 17105 • Hard termination rules under invalid numeric states (NaN/Inf), if enabled.
 17106 If any safeguards trigger during execution, the engine reports that status explicitly in the appropriate diagnostics sections.
 17107
 17108 REPRODUCIBILITY
 17109 When executed under identical configuration and random seed state, the engine is designed to reproduce identical classification outcomes and numeric outputs within the deterministic limits of the selected runtime mode and numeric precision.
 17110
 17111 17. EXECUTIVE CONTRACT (INTERPRETATION & USE)
 17112 -----
 17113
 17114 This section constitutes the executive-level interpretive and use contract governing the reading, application, and reliance upon the contents of this report and all associated outputs generated by the Omni-Compass Unified Governing Convergence Control Core Engine.
 17115
 17116 INTERPRETATION
 17117 All results, metrics, classifications, analyses, and visual artifacts presented herein are to be interpreted strictly within the context defined by the governing equation, symbol table, runtime configuration, Purpose, and Scope sections of this report.

17118
17119 No section, metric, figure, or statement shall be interpreted in isolation or construed beyond the execution context under which it was produced.

17120
17121 USE AND RELIANCE
17122 This report and its outputs are provided for technical evaluation, verification, analytical review, and decision-support purposes consistent with the permissions and restrictions defined elsewhere in this document.

17123
17124 Reliance upon the results for operational, commercial, regulatory, safety-critical, or high-stakes decision-making is subject to the execution of appropriate licensing agreements, validation procedures, and independent review as determined by the user.

17125
17126 NO WARRANTY OR GUARANTEE
17127 The results presented herein represent empirical observations derived from executed simulations. No guarantees, warranties, or assurances of future performance, correctness under untested conditions, or suitability for specific applications are expressed or implied.

17128
17129 FINALITY OF RECORD
17130 This report constitutes a complete and self-contained record of the executed run(s) described herein. No external documents, verbal statements, or supplementary materials shall modify or supersede the contents of this report absent explicit written amendment issued by The Omni-Compass LLC.

17131
17132 18. AVAILABILITY, RIGHTS, CONDITIONS & RESTRICTIONS
17133 -----
17134

17135 Availability to The Omni-Compass Unified Governing Convergence Control Core Engine is provided for simulation, testing, evaluation, validation, verification, and technical engagement under defined permissions, with commercial exploitation and operational deployment governed through formal agreements.

17136
17137 PERMITTED TECHNICAL USE
17138 -----
17139 The Omni-Compass engine may be accessed, executed, tested, simulated, evaluated, validated, verified, and analyzed for technical, internal, educational, or review purposes without the purchase of a commercial license.

17140
17141 Permitted technical use includes:
17142 • Simulation and execution testing
17143 • Validation and verification of behavior and outputs
17144 • Benchmarking and analytical review
17145 • Technical inspection of governing equations and structure
17146 • Internal research and exploratory analysis
17147 • Preliminary non-commercial personal use
17148

17149 Permitted technical and personal use is expressly limited to preliminary confirmation that The Omni-Compass engine performs as represented, including confirmation that it functions as a unification engine and infrastructure-grade system.

17150
17151 Such use is authorized solely for the purpose of determining suitability, capability, validity, and alignment.
17152

17153 Permitted use does not grant any right to monetize, commercialize, embed, distribute, sublicense, or derive revenue from The Omni-Compass engine or its outputs.

17154
17155 PUBLIC AVAILABILITY AND CONSENT
17156 -----
17157 Written consent for the permitted technical uses described herein is granted by the lawful possession, access, and execution of The Omni-Compass code and its governing equation, which are publicly available and readily obtainable.

17158
17159 Execution of the code and use of the published governing equation constitute affirmative permission to perform simulation, testing, evaluation, validation, verification, and analytical review within the bounds stated in this Availability section.

17160
17161 COMMERCIAL LICENSING
17162 -----
17163 Commercial licensing is required for any use of The Omni-Compass engine or its outputs that supports revenue generation, monetization, productization, operational deployment, paid services, or sustained integration.

17164
17165 For clarity, commercial use includes any use of The Omni-Compass engine, in whole or in part, as:
17166 • A component of any software stack or system
17167 • A module, service, daemon, library, or background process
17168 • A decision, control, optimization, or coordination layer
17169 • An input to, dependency of, or influence on business operations
17170 • A function embedded within products, platforms, pipelines, or services
17171 • Any capability contributing to the operation, efficiency, or outcomes of a company, corporation, enterprise, or organization

17172
17173 Any use of The Omni-Compass engine by a business entity, or within the operational functionality of a business, whether direct or indirect, whether labeled "core," "supporting," or otherwise, is considered commercial use.

17174
17175 Use of The Omni-Compass engine as a persistent, continuously operating, embedded, or recurring component within any system beyond preliminary testing and confirmation constitutes commercial use.

17176
17177 Any such use without an executed commercial license agreement is deemed an unauthorized deployment and a material breach of the permissions granted herein.

```
17178
17179 19. LICENSING PATHWAYS, DEPLOYMENT & COMMERCIAL TRANSITION
17180 -----
17181
17182 This section defines the pathways by which The Omni-Compass Unified Governing Convergence Control Core Engine may trans
ition from permitted technical use into licensed commercial deployment.
17183
17184 All commercial use of The Omni-Compass engine is governed exclusively by executed licensing agreements issued by The Om
ni-Compass LLC. No commercial rights are granted implicitly, by access, or by technical capability alone.
17185
17186 Omni-Compass is proprietary and all rights are reserved. Commercial use, monetization, production deployment, embedding
, productization, paid-service use, or sustained operational integration requires a separately executed written license
and applicable authorization. This new-mechanism release presently uses an introductory, nonbinding planning benchmark
equal to 10% of independently verified and contractually accepted value captured. The company-specific dollar amount,
value basis, percentage, and terms may change, be withdrawn, or be negotiated, and the benchmark is expected to increas
e as validation, demand, adoption, authorized reach, support burden, scarcity, and strategic value increase. Only a def
initive executed agreement controls. Benchmark dollar figures are not guaranteed customer results or binding commercial
terms.
17187
17188 LICENSING PATHWAYS
17189 Commercial licensing pathways may include, but are not limited to:
17190 • Evaluation-to-production transition licenses
17191 • Research and development licenses
17192 • Embedded or integrated system licenses
17193 • Enterprise-scale operational licenses
17194 • Exclusive or territory-specific licensing agreements
17195 • Long-term stewardship or acquisition-related licenses
17196
17197 Each pathway defines specific terms governing scope of use, deployment context, operational duration, usage scale, modi
fication rights, and economic consideration.
17198
17199 DEPLOYMENT CLASSIFICATIONS
17200 Licensed deployment may be classified according to use context, including:
17201 • Internal operational deployment
17202 • Customer-facing product integration
17203 • Decision-support or control-layer deployment
17204 • Persistent background or service-based execution
17205 • Distributed, cloud-based, or edge deployments
17206
17207 Deployment classification determines applicable licensing terms, compliance requirements, and audit conditions.
17208
17209 COMMERCIAL TRANSITION
17210 Transition from technical evaluation to commercial deployment occurs only upon:
17211 • Execution of a formal commercial license agreement
17212 • Satisfaction of required financial consideration
17213 • Explicit authorization of deployment scope and classification
17214 • Issuance of licensed materials or credentials, if applicable
17215
17216 Any deployment, integration, or operational use of The Omni-Compass engine prior to completion of this transition is co
nsidered unauthorized.
17217
17218 NO IMPLIED RIGHTS
17219 The existence of technical documentation, executable code, reports, or demonstrated capability does not constitute a gr
ant of commercial rights.
17220
17221 All commercial transition decisions, licensing approvals, and deployment authorizations are issued solely by The Omni-C
ompass LLC. under executed agreement.
17222
17223 20. OUTPUTS & ARTIFACTS
17224
17225 PERFORMANCE & RESOURCE USAGE (MEASURED)
17226
17227 This execution reports measured wall-clock runtime and peak process memory usage
17228 for the Monte Carlo batch completed in this run. These values are recorded directly
17229 by the executing Python runtime.
17230
17231 Measured values:
17232 • runtime_seconds: <runtime_seconds>
17233 • peak_rss_mb: <peak_rss_mb>
17234 • platform: <platform>
17235 • python: <python_runtime>
17236
17237 SCALING EXPECTATION
17238 This engine is an embarrassingly-parallel Monte Carlo executor. Runtime scales
17239 approximately linearly with the number of independent trajectories, while memory
17240 does not grow with run count beyond configured history retention and artifact output.
17241
17242 -----
17243
17244 This section enumerates all outputs and artifacts generated by the execution of the Omni-Compass Unified Governing Conv
ergence Control Core Engine.
```

17245
17246 All outputs listed herein are produced directly by executed Python runtime logic and correspond to the governing equation, symbol set, runtime configuration, and Monte Carlo procedures described elsewhere in this report.

17247
17248 GENERATED OUTPUTS
17249 The execution may generate, but is not limited to, the following artifacts:
17250 • Console execution summaries
17251 • Aggregate statistical reports
17252 • Classification and conveyance summaries
17253 • Stability and RMS metrics
17254 • Diagnostic tables and summaries
17255 • Visual plots, charts, and distributions
17256 • Representative trajectory disclosures
17257 • Machine-readable datasets

17258
17259 ARTIFACT CHARACTERISTICS
17260 All artifacts:
17261 • Are generated programmatically during execution
17262 • Reflect actual runtime data and computed results
17263 • Are not manually edited or post-processed
17264 • Are reproducible under identical configuration and random seed
17265 • Are traceable to a specific execution instance via identifiers

17266
17267 Artifacts may be emitted in multiple formats and destinations, including console output, file system storage, and report embedding, as defined by the execution configuration.

17268
17269 If specific outputs or artifact types are not generated for a given execution, this section will explicitly state their absence.

17270
17271 21. ARTIFACT FORMATS & ACCESS
17272 -----
17273
17274 This section defines the formats, structures, and access characteristics of all artifacts generated by the Omni-Compass Unified Governing Convergence Control Core Engine.

17275
17276 All artifacts described herein are generated programmatically during executed runtime sessions and correspond directly to recorded configuration, identifiers, and computed results.

17277
17278 ARTIFACT FORMATS
17279 Generated artifacts may be emitted in one or more of the following formats, as determined by execution configuration:
17280 • Human-readable documents (PDF)
17281 • Console output logs
17282 • Structured tabular data (CSV)
17283 • Line-oriented structured data (JSONL)
17284 • Serialized configuration and metadata snapshots
17285 • Image-based plots and figures (PNG or equivalent)

17286
17287 All formats are produced directly from runtime data without manual editing or post-processing.

17288
17289 ACCESS CHARACTERISTICS
17290 Artifacts are made available according to execution context and configuration, which may include:
17291 • Local filesystem output
17292 • Designated output directories per run or batch
17293 • Deterministic file naming tied to run identifiers
17294 • Timestamped and hash-linked artifact grouping

17295
17296 Access to artifacts is read-only by default and reflects the exact state of the executed run.

17297
17298 TRACEABILITY AND LINKAGE
17299 Each artifact is traceable to a specific execution instance via:
17300 • Run ID
17301 • Batch ID
17302 • Configuration hash
17303 • Execution timestamp

17304
17305 Artifacts generated from the same execution share consistent identifiers and may be cross-referenced programmatically or manually.

17306
17307 RAW DATA ACCESS
17308 For executions configured to emit raw data disclosures, machine-readable raw datasets are provided as part of the full technical artifact set. These raw artifacts contain unaggregated numeric values exactly as produced during runtime and are not altered, filtered, or normalized beyond execution logic.

17309
17310 Raw data artifacts are segregated from executive summaries and interpretive sections to preserve clarity and auditability.

17311
17312 NO IMPLIED AVAILABILITY
17313 The existence of an artifact format does not imply public or unrestricted access. Artifact access and distribution remain in subject to the permissions, restrictions, and licensing conditions defined elsewhere in this report.

17314
17315 22. VERIFICATION, EXECUTIVE IDS & TIME

```

17316 -----
17317
17318 This report and all associated outputs were generated by an executed Python runtime session.
17319
17320 The Omni-Compass Unified Governing Convergence Control Core Engine was run, evaluated, and verified by Python at the ti
me and date recorded below. The Python interpreter actively executed the governing equations, runtime configuration, an
d Monte Carlo procedures that produced the results contained in this report.
17321
17322 The timestamp reflects the actual execution time of the simulation, not a post hoc annotation or manual entry.
17323
17324 Python Runtime Verification:
17325 • Interpreter: Python (runtime recorded during execution)
17326 • Execution Mode: Direct execution of Omni-Compass engine code
17327 • Verification Basis: Successful completion of simulation, classification, and output generation without runtime error
17328
17329 Execution Timestamp:
17330 • Date: <YYYY-MM-DD>
17331 • Time: <HH:MM:SS>
17332 • Timezone: <UTC offset>
17333
17334 Run Identifier:
17335 • PERF: runtime_seconds=<runtime_seconds>, peak_rss_mb=<peak_rss_mb>
17336 • Run ID: <UUID or hash>
17337 • Configuration Hash: <hash of parameters/config>
17338 • Code Fingerprint: <source fingerprint>
17339
17340 This section certifies that the results presented herein were produced by an actual Python execution of the Omni-Compas
s engine under the recorded environment and configuration.
17341

18607             "Scope rule. The statements below are conditional mathematical results for the disclosed hybrid map. They d
o not relabel finite Monte Carlo evidence as a global proof, and they do not assert that every hypothesis is satisfied
outside the executed parameter and state domain.",
18608             "Lyapunov decomposition. The strongest unconditional stability statement supplied by the current operator i
s jump-wise, not full-step: for  $W(U)=(U-\sigma)^2$ , the canonical  $P_{\sigma}/R_{\text{basin}}$  jump satisfies  $W(P_{\sigma}(U))\leq W(U)$ , wit
h strict decrease for pre-jump states outside the signed basin. This is H7 and is machine-checked over the declared aud
it grid. It must not be rewritten as  $W_{\{m+1\}}\leq W_m$  for the entire bounded zero-order-held RK4 map unless the intervening
RK4 map is separately shown non-expansive or contractive relative to the same basin metric.",
18609             "Exact S-channel dissipation. With  $\Phi(S)=0.5\alpha_s S^2 + 0.25\beta_s S^3 - \delta S$  and  $dS/dt=-d\Phi/dS$ , t
he isolated S-channel obeys  $d\Phi/dt=-(d\Phi/dS)^2\leq 0$  exactly. The correct Lyapunov candidate around a stable equilibrium
is the shifted potential  $V_S=\Phi(S)-\Phi(S^*)$ , not the unshifted  $\Phi$  unless the origin and parameters make that form pos
itive definite. If  $\Phi'(S^*)>0$  at an isolated critical point,  $V_S$  is locally positive definite and gives the conditiona
l local result H8.",
18610             "Discrete barrier certificate. For  $h_{\sigma}(U)=\text{BASIN\_TOL}^2-(U-\sigma)^2$  and implementation margin  $m=\max(\text{EPS}, \text{BASIN\_TOL}*1e-9)$ , the canonical post-projection clamp gives  $|U+\sigma|\leq \text{BASIN\_TOL}-m$ , hence  $h_{\sigma}(U+)=2*\text{BASIN\_TOL}*m-m^2>0$  for every finite pre-projection  $U$ . This is an exact one-jump reachability and sampled-state invariance certificate f
or the locked signed basin. It is stronger than a finite grid observation but does not claim continuous-time safety bet
ween projection events.",
18611             "Conditional S-flow contraction. Since  $F_{\text{state}}'(S)=-\alpha_s-(3/2)\beta_s S$ , any interval  $I$  with  $\alpha_s+(3/2)\beta_s S\geq \mu>0$  is contractive for the isolated S dynamics. Solutions that remain in  $I$  satisfy  $|S_1(t)-S_2(t)|\leq \exp(-\mu t)|S_1(0)-S_2(0)|$ . This supplies an explicit contraction margin and promotion gate without extending the result to the cou
pled six-state system.",
18612             "Local Lipschitz proposition. On any compact domain  $D$  on which  $E_{\text{max}}$  is bounded below by a positive constan
t, the continuous Piece I vector field is continuously differentiable because it is composed of polynomials, tanh, cosi
ne, affine terms, and divisions only by  $E_{\text{max}}$  and  $Q_B$  bounded away from zero. Therefore  $f$  is Lipschitz on  $D$  with an exp
licit computable bound  $L_D = \sup_{x \in D, t \in [0, T]} \|J_f(x, t)\|$ . The complete Jacobian entries are determined by the
printed equations; the finite numerical evidence reports sampled local stiffness diagnostics but is not represented as
the global supremum  $L_D$ .",
18613             "RK4 error bound. If  $f$  has bounded derivatives through order five on  $D$  and the exact and numerical solution
s remain in  $D$ , classical RK4 has local truncation error  $O(h^5)$  and global error  $O(h^4)$ . A conservative global form is  $|e_n| \leq ((\exp(L_D T)-1)/L_D) C_5 M_5 h^4$ , where  $M_5$  bounds the required fifth total derivative and  $C_5$  is the RK4 met
hod constant. The report separately supplies observed refinement order and DOP853 concordance; those measurements valid
ate the tested execution but do not replace the stated assumptions.",
18614             "Projection non-expansiveness theorem. For a declared signed basin interval  $I_{\sigma}=[\sigma-\tau, \sigma+\tau]$ ,
the scalar clipping projection  $P_{I_{\sigma}}$  is 1-Lipschitz:  $|P_{I_{\sigma}}(a)-P_{I_{\sigma}}(b)| \leq |a-b|$ . Because  $P_{\sigma}$  leaves the other five c
oordinates unchanged, its Euclidean extension is non-expansive. Proof: metric projection onto a closed convex interval
is non-expansive; applying the identity to the remaining coordinates preserves the inequality.",
18615             "Conditional Banach theorem. Let  $R_h$  be the one-microstep RK4 map restricted to a complete metric subset  $X$ 
of the declared basin, and suppose  $\|R_h(x)-R_h(y)\| \leq q\|x-y\|$  for  $q<1$ . Since  $P_{\sigma}$  is non-expansive,  $\|P_{\sigma}R_h(x)-P_{\sigma}R_h(y)\| \leq q\|x-y\|$ . Banach's fixed-point theorem then gives one fixed point in  $X$  and geometric convergenc
e from every initial point in  $X$ . The engine does not claim that  $q<1$  has been established globally; the theorem identifi
es the exact additional condition required.",
18616             "Conditional local Lyapunov theorem. For an equilibrium  $x^*$  of a continuously differentiable active sub syste
m with Hurwitz linearization  $A$ , choose  $Q$  positive definite and solve  $A^T P + P A = -Q$ . If the nonlinear remainder obeys  $\|r(z)\| \leq \gamma\|z\|^2$  locally,  $V(z)=z^T P z$  decreases for  $\|z\| < \lambda_{\min}(Q)/(2\|P\|\gamma)$ . The reported 5/6 vec
tor-field Jacobian rank is not a controllability test:  $I_U$  is an observer channel absent from the other derivatives. A
separate input matrix and controllability/observability analysis are required before any full-state control claim.",

28206     return f"""# Public Enterprise Manager Mechanism Benchmark - Mathematical Contract
28207
28208     ## Scope
28209     Only publicly obtainable, open-source, paid commercial, or publicly documented customer-facing systems are numerically
28210     modeled by default. Private internal orchestration systems are excluded from named numerical claims.
28211
28212     ## Independent and aggregate economic benefit doctrine
28212     Omni-Compass benefit is evaluated as separable labor/capacity, infrastructure, energy/thermal, reliability, software/to
28213     oling, and integration surfaces. A labor/capacity benefit may justify deployment independently. A non-labor infrastru
28214     cture benefit may justify deployment with engineering headcount held constant. Aggregate benefit is permitted only after
28215     causal overlap is assigned once and all implementation, residual, security, governance, and operating costs are deducte
28216     d. The adopting organization defines the authority envelope and receives no benefit credit for unobserved or unauthoriz
28217     ed systems.
28218
28219     ## Private-system pilot bridge
28220     {PM_PRIVATE_SYSTEM_PILOT_DISCLOSURE}
28221
28222     ## No-output-target rule
28223     No manager profile contains a savings percentage, annual savings dollar value, throughput result, latency result, or Om
28224     ni-Compass outcome. Profiles contain only declared mechanism coefficients, workload applicability, environment fit, ope
28225     rational overhead, engineering complexity, and publicly visible software-free inputs where available. Evaluator-supplied
28226     profiles are rejected if they contain result or savings targets.
28227
28228     ## Manager mechanism score
28229     For manager `j`, workload domain `d`, and mechanism axis `a`:
28230
28231     
$$q[j,d] = \sum_a R[d,a] * M[j,a]$$

28232     where each requirement row `R[d,*]` sums to one. The estate score is an applicability-weighted workload average.
28233
28234     ## Runtime governance
28235     Manager-alone quality is derived from the manager mechanism score, workload coverage, environment fit, control overhead
28236     , mismatch, and fragmentation. Omni-Compass overlay gain is proportional to the unresolved mechanism gap, observed cano
28237     nical readiness, regulation effort, workload mismatch, and cross-manager fragmentation.
28238
28239     ## Comparator-independent Omni-Compass direct rule
28240     For a fixed canonical run `r`, environment `e`, and normalized scale `N`, the absolute Omni-Compass-direct execution is
28241     one mechanism:
28242
28243     
$$C\_direct(r,e,N \mid manager=j) = C\_direct(r,e,N)$$

28244     for every incumbent manager `j`. The same identity is required for throughput, latency, availability, incident loss, en
28245     ergy, staffing, and all other direct metrics. Savings may differ by manager because the incumbent baseline denominator
28246     differs:
28247
28248     
$$Savings\_direct[j] = C\_manager[j] - C\_direct$$

28249     This corrects the invalid behavior in which the named comparator leaked into the direct mechanism.
28250
28251     ## Matched comparison
28252     For each canonical run, environment, manager, and scale, the disturbance seed excludes execution variant. Manager alone
28253     , manager + Omni-Compass, and Omni-Compass direct receive the same demand, utilization noise, failure shock, security e
28254     xposure, workload vector, and one-stack cost ledger.
28255
28256     ## Financial effect
28257     
$$Savings[j,v,N] = Cost[j,manager-alone,N] - Cost[j,v,N]$$

28258
28259     
$$SavingsPct[j,v,N] = Savings[j,v,N] / Cost[j,manager-alone,N]$$

28260
28261     
$$GrossPreTaxProfitUplift = OperatingLossReduction = Savings$$

28262     before Omni-Compass licensing, implementation, taxes, and company-specific reconciliation. One complete stack is the co
28263     ntrolling unit; 10, 100, and 1,000 stacks are exact duplications, so the percentage is invariant across those declared
28264     normalized scales for a fixed manager/environment/run population.
28265
28266     ## Declared profile uncertainty study
28267     The fragmentation penalty is a declared assumption equal to `PM_FRAGMENTATION_PENALTY_PER_EXTRA_MANAGER = 0.018` per ad
28268     ditional selected public manager. The engine publishes a 3,000-draw simultaneous jitter study at  $\pm 5\%$ ,  $\pm 10\%$ ,  $\pm 20\%$ ,  $\pm 30\%$ ,
28269     and  $\pm 50\%$  over manager/direct mechanism, applicability, environment-fit, control-overhead, and fragmentation assumption

```

```

s, plus a systematic adverse-bias break-even sweep. This is an uncertainty analysis of declared inputs; it is not produ
ction telemetry.
28255
28256 ## Acceptance gates
28257 The engine fails the public-manager release if direct absolute outputs vary by incumbent comparator, if matched disturb
ance identifiers differ across variants, if normalized scale invariance fails, if profile outputs are insufficiently di
verse, or if a report-population mean Omni-Compass benefit is negative. Negative values are not clamped or silently rew
ritten; they stop the benchmark so the mechanism or scope error must be corrected.
28258
28259 ## Claim boundary
28260 The model is executable and falsifiable, but it is not the source code of the named products, a vendor-certified benchm
ark, a customer invoice, or a production deployment. Evaluators replace mechanism/cost assumptions with product telemet
ry, configuration, invoices, staffing, incident history, and live matched trials.

4  """What each mechanism contributes. The confirmatory setting (tuning/GLOBAL_LEAGUE_PREREGISTRATION.json) against
5  versions with one mechanism removed, on 30 fresh scenarios per workload (seeds 711001-711030), paired:
6  gate_off      the six-state engine's equation-(2) push no longer gates releases (push_release = infinity)
7  no_turn       releases no longer wait for the turning point (Chapters 29-30)
8  no_tone       released machines are powered off instead of parked (no warm reserve)
9  no_trend      the dual bath's rate is removed (b = 0: level only, no forecast of the trend)
10 no_closure    the closure law is removed; machines follow the engine-driven speed governor (the earlier C)
11 Reported: mean change of every gauge against the full law (positive = the removal made it worse) with a paired 95%
12 bootstrap interval, plus contradictions (controllers fighting, quick reversals). Usage: python tuning/ablation.py"""

4  """Physical bound: what a controller with perfect knowledge of the future could achieve on node-hours and machine churn
   .
5
6  For each scenario the pods (and their CPU requests) are those produced by HPA 70% (the platforms' setting). A node count
7  n(t) is feasible when it holds every pod:  $n(t) \geq \text{ceil}(\text{requests}(t) / (\text{cores} \times \text{ALLOC}))$ , within [min, max] nodes. Dynamic
8  programming finds, for a price lambda on node-hours, the trajectory minimising starts+stops + lambda x node-ticks; sweeping
9  lambda traces the frontier: the fewest starts+stops possible for each node-hour budget. (Boot delay is ignored, which
10 only favours the bound.) If a competitor's node-hours and another competitor's starts+stops lie below this frontier, no
11 controller whatsoever can match both, Omni-Compass included.

4  """Confirmatory run. The single global closure-law setting frozen in tuning/GLOBAL_LEAGUE_PREREGISTRATION.json is run
5  once on 100 never-used scenarios per workload (seeds 710001-710100) against the seven platforms, every gauge. For each
6  of the 364 (workload x platform x gauge) cells: the paired mean difference, its bootstrap distribution (10,000
7  resamples), a two-sided bootstrap p-value, and the Holm-Bonferroni step-down correction across all 364 cells at family
8  alpha 0.05. A cell is reported better / worse only if it survives the correction and the difference exceeds the 0.5%
9  practical tolerance (0.5 events for counts); otherwise it is equal. Every earlier held-out round is listed in the output
10 with its seed range. Usage: python tuning/confirmatory.py -> tuning/CONFIRMATORY.json
11
12 --coord: the same frozen setting with the nervous-system coordination switched on (ClosureLaw coord=True: pods are
13 stepped first, a machine move opposite to the pod move is vetoed). Fresh seeds 712001-712100, frozen in
14 tuning/COORD_PREREGISTRATION.json (setting, seeds, SHA-256 of the code) before the first scenario runs. Same 364 cells,
15 same Holm correction; controller contradictions per arm reported beside the family (not added to it).
16 -> tuning/CONFIRMATORY_COORD.json"""

4  """Can Omni-Compass be equal or better than EACH competitor on EVERY gauge? (development seeds 101-110)
5
6  Two questions, answered from one search:
7      individually for each competitor and vessel: is there an Omni configuration with no losing gauge against it?
8      all at once for each vessel: is there one Omni configuration with no losing gauge against every competitor?
9  Candidate Omni configurations: the frozen fleet-law family with free constants, and the speed-law family
10 (omnicompass/speed.py); the engine equations are unchanged. A loss is as in tuning/league.py (worse beyond 0.5% and the
11 paired bootstrap 95% interval excludes zero).
12 Usage: python tuning/dominate.py N SEED

4  """Prototype law v2: two structural changes to how the engine's directive becomes actions (adapter.directive_to_actions
5  is frozen and is not edited; v2 wraps it).
6
7  1. Replicas (direct actuation) are sized with the engine's own sizing equation, the one it uses for nodes:
8       $r^* = \text{ceil}(r * \text{load} / \text{rho}^* + kq * q * r)$ 
9      and may rise whenever there is backlog, not only when the node decision points up.
10  2. The power cap moves only when the change exceeds a dead-band AND the equation (2) control push has converged
11      ( $|\text{push}| \leq \text{push\_release}$ ), the same gate the engine applies to releasing capacity; raising the cap is never delayed.

4  """League table: every competitor against Omni-Compass, one at a time, on every gauge and every vessel.
5
6  Rule (the owner's): Omni-Compass must be equal or better than EACH competitor on EACH gauge. A cell is a loss when the
7  competitor is better by more than the tolerance AND the paired bootstrap 95% interval excludes zero. Every loss goes on
8  the attack list.
9
10 Competitors, each at its documented defaults (fleet plant with response time, fleet/sim_slo.py; vendor arms emulate
11 documented behaviour, not the vendors' binaries):
12     k8s_hpa70_ca    Kubernetes: HPA (70%, the target of every earlier study) + Cluster Autoscaler (= GKE balanced)
13     openshift, gke_optimize, aks_nap (= Karpenter, also EKS Auto Mode), turbonomic, cast_ai, spot_ocean
14 Omni-Compass: one configuration per vessel type (web, multi, batch, gpu), chosen from the candidates below as the one w
15 ith
16 the fewest losses on the development seeds. The operator declaring the vessel type is a human-set boundary.
17 Usage: python tuning/league.py [dev|heldout] [candidates.json]
