1106 # =====
1107 # OMNI-COMPASS AUTHENTICITY, PROVENANCE AND LEGAL-DISCLOSURE LAYER
1108 # -----
1109 # PURPOSE
1110 # This engine is published as source so that it can be read, audited, executed
1111 # and independently replicated. An unavoidable consequence of publishing source
1112 # is that any recipient can alter a copy, execute the altered copy, and present
1113 # the resulting output as an Omni-Compass result. This layer makes that

```

```

1114 # substitution immediately and provably detectable.
1115 #
1116 # WHAT THIS LAYER IS
1117 # Tamper-EVIDENCE. The engine recomputes its own canonical digest at startup,
1118 # compares it against the digest published for the authentic release, prints a
1119 # prominent banner on mismatch, and stamps the verdict into the provenance
1120 # block of every report it generates.
1121 #
1122 # WHAT THIS LAYER IS NOT
1123 # Tamper-PREVENTION. No mechanism inside a published source file can prevent
1124 # that file from being edited. A determined actor can delete this block. Doing
1125 # so is a deliberate and documented act of removal, it changes the digest by
1126 # which the file is identified, and it places the resulting file outside the
1127 # licence granted for this work. The engine additionally writes an external,
1128 # standalone verifier into every output directory so that verification never
1129 # depends solely on code living inside the file being verified.
1130 #
1131 # INTEGRITY SCOPE
1132 # The digest covers every byte of this file except the single line carrying the
1133 # published digest value, which is excluded so that sealing the value in does
1134 # not invalidate the value. Nothing else is exempt.
1135 # =====

1230 OC_FULL_LICENSE_TEXT = ""OMNI-COMPASS REFEREE ENGINE
1231 SOURCE-AVAILABLE EVALUATION LICENSE
1232 Version 1.0
1233
1234 Copyright (c) 2026 The Omni-Compass LLC. All rights reserved.
1235 Creator / Developer of record: AJ Dubra.
1236 Owner of record: The Omni-Compass LLC, a Delaware limited liability company.
1237
1238 THIS IS NOT AN OPEN SOURCE LICENSE. The source code is published so that it
1239 can be read, audited, executed and independently verified. It is not published
1240 for redistribution, for incorporation into other products, or for production
1241 use.
1242
1243 1. DEFINITIONS
1244
1245 "Software" means the Omni-Compass Referee Engine source file(s) distributed
1246 under this License, together with accompanying verification tooling and
1247 documentation.
1248
1249 "Authentic Release" means a copy of the Software that is byte-identical to
1250 a release published by the Licensor at the Official Source, as confirmed by
1251 the published canonical SHA-256 digest for that release.
1252
1253 "Official Source" means https://www.omni-compass.com.
1254
1255 "Modified Copy" means any copy of the Software that is not an Authentic
1256 Release, regardless of how small the difference is.
1257
1258 "Marks" means the names "Omni-Compass", "Omni-Compass", "Omni-Compass Referee
1259 Engine", and any associated logos or product names of the Licensor.
1260
1261 2. GRANT
1262
1263
1264 Subject to every condition below, the Licensor grants you a worldwide,
1265 royalty-free, non-exclusive, non-transferable, revocable license to:
1266
1267 (a) download and retain a copy of the Software;
1268 (b) read, study, review and analyze the source code;
1269 (c) execute the Software for the purposes of evaluation, verification,
1270 replication, benchmarking, academic study and internal assessment; and
1271 (d) publish the results of that evaluation, including results that are
1272 critical of the Software, provided you comply with Section 5.
1273
1274 You may run the Software as many times as you wish, with any seed, and
1275 publish the resulting reports.
```

1276
1277
1278 3. RESTRICTIONS
1279
1280 You may NOT:
1281
1282 (a) redistribute, republish, mirror, resell, sublicense or otherwise convey
1283 the Software or any part of it to any third party. Direct others to the
1284 Official Source instead;
1285
1286 (b) publish, distribute or make available any Modified Copy;
1287
1288 (c) use the Software in production, or as a component of any product or
1289 service offered to third parties, without a separate written commercial
1290 license from the Licensor;
1291
1292 (d) remove, disable, bypass, obscure or alter the authenticity self-check,
1293 the integrity digest, the authenticity banner, the provenance block, or
1294 any attribution or copyright notice contained in the Software;
1295
1296 (e) misrepresent the origin, authorship, provenance or authenticity of the
1297 Software or of any output it produces.
1298
1299
1300 4. MODIFICATION AND MANDATORY RENAMING
1301
1302 You may modify your own copy of the Software for private study and testing.
1303
1304 If you make any modification, then that copy is a Modified Copy and:
1305
1306 (a) it MUST NOT be called Omni-Compass, Omni-Compass Referee Engine, or any
1307 name confusingly similar to the Marks;
1308
1309 (b) it MUST NOT display, print, embed or otherwise present any of the Marks
1310 in its output, documentation, interface, filenames or metadata;
1311
1312 (c) it MUST carry a clear notice, at the top of the source file and in all
1313 output it produces, stating that it is a modified derivative and is NOT
1314 the Omni-Compass Referee Engine;
1315
1316 (d) it MUST retain and MUST NOT alter the authenticity self-check, so that
1317 the modification remains detectable; and
1318
1319 (e) its output MUST NOT be presented, described, cited, published or
1320 implied to be Omni-Compass results, Omni-Compass performance, or evidence
1321 about the behavior, correctness or capability of Omni-Compass.
1322
1323 This condition follows long-established practice for reference
1324 implementations, most notably Donald Knuth's condition on TeX: a program
1325 that has been changed may not carry the original name.
1326
1327
1328 5. TRUTHFUL ATTRIBUTION OF RESULTS
1329
1330 You are free to publish results, including negative results, criticism,
1331 benchmarks and failure reports. That freedom is deliberate. The Licensor
1332 invites scrutiny.
1333
1334 You must, however, when publishing any result attributed to the Software:
1335
1336 (a) state the canonical SHA-256 digest of the exact file you executed;
1337 (b) state the Python version and the versions of all dependencies used, or
1338 state the digest of the published container image if one was used; and
1339 (c) state the seed and any command-line arguments used.
1340
1341 Publishing output as Omni-Compass results when it was produced by a Modified
1342 Copy, or by an unstated or altered environment, is a breach of this License
1343 and may additionally constitute trademark infringement, false designation
1344 of origin, and commercial disparagement.
1345
1346
1347 6. TRADEMARKS
1348
1349 The Marks are the property of the Licensor and are NOT licensed under this
1350 License. No right to use the Marks is granted except the limited right to
1351 refer to the Software accurately and descriptively, in the manner of
1352 ordinary nominative fair use, when reporting Authentic Release results.
1353
1354
1355 7. NO WARRANTY
1356

```

1357 THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR
1358 IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY,
1359 FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT.

1361
1362 8. LIMITATION OF LIABILITY
1363
1364 IN NO EVENT SHALL THE LICENSOR BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER
1365 LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING
1366 FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER
1367 DEALINGS IN THE SOFTWARE.
1368
1369
1370 9. TERMINATION
1371
1372 This License terminates automatically and immediately if you breach any of
1373 its terms. On termination you must destroy all copies of the Software in
1374 your possession. Sections 4, 5, 6, 7 and 8 survive termination.
1375
1376
1377 10. GOVERNING LAW
1378
1379 This License is governed by the laws of the State of Delaware, United States of America, without
1380 regard to its conflict of law provisions.

1861 # =====
1862 # AUDIT FIX D1 - AUTHORED TEXT VERSUS COMPUTED OUTPUT
1863 # =====
1864 # A reader holding a 300-page document produced by a Python program cannot tell,
1865 # from the page alone, which sentences were WRITTEN BY A PERSON and which were
1866 # COMPUTED BY THE PROGRAM FROM THIS RUN. That distinction decides how much
1867 # weight each sentence carries, and leaving it implicit is the most consequential
1868 # ambiguity in the whole publication: a reader may assume the engine "concluded"
1869 # something it merely printed, or may discount a computed figure as marketing.
1870 #
1871 # Omni-Compass therefore states its own position explicitly. Three classes of
1872 # text exist in every artifact this engine emits, they are not interchangeable,
1873 # and the distinction is hardwired here rather than left to the reader.
1874 # =====
1875
1876 OC_TEXT_CLASS_DEFINITIONS = (

1919 "\n"
1920 "BOUND text is an authored sentence with computed values substituted into it. It carries the "
1921 "authority of its computed values and the accountability of its authored frame, and no more "
1922 "than either.\n"
1923 "\n"
1924 "WHY THIS IS STATED AT ALL. A reader could reasonably assume that a document generated by a "
1925 "mathematical engine represents the engine's conclusions throughout. That assumption would be "
1926 "wrong and would overstate this package. The mathematics establishes what the mathematics "
1927 "establishes; the surrounding prose is a human argument about its significance, written by an "
1928 "interested party. Omni-Compass would rather a reader discount the prose and test the numbers "
1929 "than accept the prose because a computer printed it.\n"
1930 "\n"
1931 "WHERE THE LINE FALLS IN PRACTICE. If a sentence contains a figure that would change on the "
1932 "next run, the figure is COMPUTED. If a sentence would read identically no matter what the "
1933 "run produced, it is AUTHORED. Disclaimers, claim boundaries and falsifiers are AUTHORED by "
1934 "design: they are commitments made in advance, deliberately not contingent on whether the "
1935 "results turned out well.\n"
1936 "\n"
1937 "This disclosure is itself AUTHORED text, hardwired in the engine source, and is emitted into "
1938 "every release so that no recipient of any artifact is left to infer the distinction."
1939 )
1940
1941
1942 OC_OWNER_DEVELOPMENTAL_EXECUTION_REPRESENTATION = (
1943 "WHY THE AUTHORED PROSE IN THIS PACKAGE IS WRITTEN WITH CONFIDENCE - OWNER REPRESENTATION\n"
1944 "\n"
1945 "A reader may fairly ask why the doctrinal text in this package states its positions plainly "
1946 "rather than hedging every sentence. The answer is a representation by The Omni-Compass LLC, "
1947 "and it is placed here rather than left to be inferred.\n"
1948 "\n"
1949 "The owner represents that this engine and its predecessors have been executed, re-executed, "
1950 "instrumented, broken, retuned and re-run continuously throughout development - across a very "
1951 "large number of executions, parameter settings, seeds, horizons, gains, tolerances and "
1952 "failure injections - long before any of it was published. The authored statements in this "
1953 "package are therefore written from repeated observation of this mechanism's behaviour. They "
1954 "are not speculation drafted around a single successful run.\n"
1955 "\n"
1956 "THAT DEVELOPMENTAL RECORD IS NOT OFFERED AS EVIDENCE IN THIS PACKAGE AND MUST NOT BE COUNTED "
1957 "AS ANY PART OF IT. It carries no manifest, no digest, no seed record and no artifact in this "
1958 "release. It explains the CONFIDENCE OF THE AUTHORED PROSE. It establishes nothing. Every "
1959 "quantitative statement anywhere in this package is bound to the executed campaign recorded "
1960 "in this run's manifest and to nothing else, and where this report states a run count, that "
1961 "count is the count of THIS campaign.\n"
1962 "\n"
1963 "The owner draws the line deliberately. A developmental history that a reader cannot inspect "
1964 "is worth exactly nothing as proof, and Omni-Compass declines to trade on it. What the reader "
1965 "can inspect is the engine, the seed, the digest, the raw rows and every artifact this "
1966 "execution wrote. Those are the proof. The representation above is context for why the prose "
1967 "reads the way it does, and it is falsifiable only as a representation about the owner - not "
1968 "as a result about the mechanism."
1969 )

2162 # =====
2163 # KUBERNETES HORIZONTAL POD AUTOSCALER - REFERENCE IMPLEMENTATION TO SPECIFICATION
2164 # -----
2165 # WHY THIS EXISTS
2166 #   A benchmark baseline merely LABELLED "Kubernetes" is not checkable. A
2167 #   reviewer cannot tell whether it behaves as Kubernetes behaves. This module
2168 #   implements the PUBLISHED HPA control law to specification so the baseline can
2169 #   be audited line by line against the Kubernetes documentation.
2170 #
2171 # ALGORITHM AS PUBLISHED
2172 #   desiredReplicas = ceil( currentReplicas * ( currentMetricValue / desiredMetricValue ) )
2173 #   - A tolerance band suppresses action when the ratio is already near 1.0.
2174 #   - The result is clamped to [minReplicas, maxReplicas].
2175 #   - Where several metrics are configured, the maximum desired count is taken.
2176 #   - Scale-down is held by a stabilization window; scale-up may be immediate.
2177 #   - CPU utilisation is expressed relative to the Pod's resource REQUESTS.
2178 #
2179 # WHAT THIS IS
2180 #   A faithful, deterministic reference model of the documented control law,
2181 #   executed against the same synthetic disturbance as the comparator.
2182 #
2183 # WHAT THIS IS NOT
2184 #   This is NOT a live Kubernetes cluster, NOT an API client, and NOT evidence of
2185 #   production behaviour. No cluster is contacted. Nothing here establishes that
2186 #   either control law governs a real deployment. It establishes only that the
2187 #   comparison baseline is the documented algorithm rather than an arbitrary
2188 #   synthetic profile.

2239     # -----
2240     # AUDIT FIX M1 - THE STABILIZATION WINDOW DID NOT MATCH THE PUBLISHED LAW
2241     # -----
2242     # DEFECT (prior builds): scale-down stabilization was implemented as a
2243     # CONSECUTIVE COUNTER that reset to zero on any in-tolerance sample:
2244     #
2245     #     else:
2246     #         since_scaledown_candidate = 0     # any no-op reset the count
2247     #
2248     # Published Kubernetes behaviour is different. The controller retains a
2249     # HISTORY of replica recommendations over the stabilization window and, when
2250     # scaling down, applies the MAXIMUM recommendation in that window. It does
2251     # not require N consecutive scale-down votes, and an in-tolerance sample does
2252     # not reset anything.
2253     #
2254     # The difference is not cosmetic. Under the old code, with a 20-step window
2255     # and a synthetic load whose level changed every 16 steps, the HPA arm could
2256     # essentially never scale down: it ratcheted up and stayed. The reported gap
2257     # between the two arms was therefore produced by a 20-step consecutive hold
2258     # versus a 3-step dwell - a hysteresis parameter asymmetry - rather than by
2259     # the structural difference between instantaneous-ratio and sustained-
2260     # deviation control that the surrounding prose claims it demonstrates.
2261     #
2262     # That also tripped the section's own stated falsifier: "this section is
2263     # falsified if the reference implementation departs from the published
2264     # algorithm." It departed. It no longer does.

2525 # -----
2526 # AUDIT FIX M2a - A NEVER-EXECUTED FUNCTION WAS BEING SHIPPED TO AUDITORS
2527 # -----
2528 # DEFECT (prior builds): "apply_invariant_basin_regulation" was listed here, so
2529 # it was extracted verbatim into the core isolation module handed to auditors -
2530 # under a header stating "Every function below is the VERBATIM source text that
2531 # executed." That sentence was FALSE for this one function: it is not called
2532 # anywhere on the canonical path. Worse, what it does is assign U directly
2533 # (a hard clamp of the state into the basin band), which is exactly the
2534 # post-integration state overwrite that the report's headline denies.
2535 #
2536 # An auditor unit-testing the extract would have found a state-projection
2537 # regulator, cross-referenced the claim matrix, found it bound to a PASS claim,
2538 # and reasonably concluded the "no post-RK4 overwrite" statement was marketing.
2539 # It is not - the executed path is clean - but the package handed them the
2540 # evidence to think otherwise. The surface list now contains only functions
2541 # that actually execute.

2552
2553     WHY THIS EXISTS
2554     -----
2555     This engine is a single large file. An auditor wishing to unit-test the
2556     governing equation, the integrator, the basin predicates and the
2557     qualification classifiers should not have to isolate them by hand from tens
2558     of thousands of lines. Difficulty of isolation is itself a reproducibility
2559     defect, independent of whether the mathematics is correct.
2560
2561     This routine reads the executing file and lifts the locked core surfaces
2562     verbatim, by source text, using the same surface list the core-integrity
2563     lock protects. Nothing is paraphrased, reimplemented or simplified: the
2564     emitted extract contains the identical bytes that executed. An extract that
2565     differed from the engine would be worse than no extract at all.

2917     """Propagate the declared uncertainty bands instead of reporting point estimates.
2918
2919     WHY THIS EXISTS
2920     -----
2921     This package declares uncertainty bands on its economic drivers but has
2922     historically reported single-point scaled figures. A point estimate drawn
2923     from banded inputs overstates precision no matter how carefully the bands are
2924     disclosed elsewhere. This routine samples each declared band independently
2925     and reports the resulting distribution of the decision-relevant quantity.
2926
2927     Sampling is triangular over each declared band, centred on the declared
2928     point value: the endpoints are the declared limits and the mode is the
2929     declared estimate. Triangular is used rather than normal because the bands
2930     are declared as bounded ranges, not standard deviations, and a bounded
2931     distribution must not place mass outside its own declared limits.
2932
2933     The result is a model-form uncertainty distribution. It is NOT a confidence
2934     interval on a measured quantity, and it is NOT a forecast.
2935
2936     -----
2937     AUDIT FIX B4 - PROPAGATION MOVED FROM THE DIFFERENCE TO THE COMPONENTS
2938     -----
2939     DEFECT (prior builds): the declared bands were applied MULTIPLICATIVELY to
2940     the already-computed advantage, i.e. to a DIFFERENCE of two large numbers.
2941     Two consequences, both material:
2942
2943     (1) probability_advantage_not_positive was STRUCTURALLY ALWAYS ZERO. Every
2944     band floor is 1 - 0.40 = 0.6 > 0, so the product of the triangular
2945     factors is strictly positive, so advantage * factor > 0 whenever the
2946     advantage is positive. The statistic could not take any other value.
2947     Publishing "probability the advantage is not positive: 0.0000" read as a
2948     strong risk finding and was a tautology.
2949
2950     (2) The interval was understated by roughly an order of magnitude. At the
2951     batch e706d5a8-8 reference values (baseline $800,218/yr, contender
2952     $692,950/yr, advantage $107,268/yr) the shipped method returned a
2953     p05-p95 span of about $63,700. Propagating the same declared bands on
2954     each ARM independently returns a span of about $625,900 and a ~29%

```

```

2955         probability that the advantage is not positive.
2956
2957     Applying a band to the difference implicitly assumes PERFECT CORRELATION of
2958     model-form error between the baseline arm and the contender arm. That
2959     assumption was never stated. For direct_operating_cost it is defensible -
2960     both arms are priced off the same published rates. For
2961     incident_loss_model_form it is clearly wrong: the entire advantage IS the
2962     differential incident model, so its error is precisely the part that is NOT
2963     shared between arms.
2964
2965     This routine therefore propagates on the components and reports THREE cases:
2966
2967     * "correlated" - one shared factor drives both arms. This is the prior
2968                     behaviour, retained as the optimistic bracket, now
2969                     labelled with the assumption it makes.
2970     * "independent" - each arm draws its own factors. Pessimistic bracket.
2971     * "mixed" - PRIMARY. Shared-rate drivers (direct operating cost)
2972                 are drawn once and applied to both arms; differential
2973                 drivers (incident model form, physical performance) are
2974                 drawn per arm. This matches how the model is actually
2975                 constructed.
2976
2977     The decision-relevant statistic is reported from the MIXED case, and the two
2978     brackets are published beside it so no reader has to take the correlation
2979     assumption on trust.

3263
3264     WHY THIS EXISTS
3265     -----
3266     The cost model of this package is linear in stack count. Linearity is a
3267     modelling choice, not an observed property, and a linear projection to 1000
3268     stacks is arithmetic rather than evidence. Declaring that limitation is
3269     necessary but insufficient: a reviewer cannot judge how much the conclusion
3270     depends on the choice without seeing the alternatives.
3271
3272     This function recomputes the projection under a declared family of exponents
3273     spanning sublinear (volume pricing, shared overhead) through superlinear
3274     (coordination overhead, topology effects, correlated failure, staffing

```

```

3275     discontinuities). The reported band is the range of defensible model forms,
3276     not a confidence interval and not a prediction.

3988 EXECUTION_CONTRACT (RUNTIME ATTESTATION)
3989 -----
3990 This console output and all generated artifacts are emitted directly by
3991 a live Python execution of this script.
3992
3993 The reported results are the exclusive consequence of:
3994 • the declared program logic
3995 • the runtime configuration snapshot
3996 • the sampled parameters drawn within declared ranges
3997 • the RNG state used during this execution
3998
3999 No paraphrase, substitution, omission, or post-processing is performed
4000 by the engine when emitting its own reports and artifacts.

```

```

4001
4002 PARAMETER FIXITY + TUNABILITY NOTICE
4003 -----
4004 This run uses a fixed configuration snapshot (printed below) and sampled
4005 parameters drawn within declared ranges.
4006
4007 These results are not absolute or maximal. A reviewer may strengthen,
4008 weaken, accelerate, delay, or reshape basin capture and stability behavior
4009 by adjusting configuration knobs and/or parameter ranges (e.g., basin_tol,
4010 stability_window, macro_steps/cutoff, dt/micro_steps, forcing/coupling).

4135 # =====
4136 # GRANDMASTER CANONICAL DYNAMIC CONTROL CORE
4137 # =====
4138 # Both signed basins are genuine equilibria of the default continuous U field.
4139 # Supervisory authority enters the derivative as a bounded zero-order-held
4140 # actuator command. No canonical execution writes U after integration.
4141 # CERTIFIED PROPORTIONAL GAIN.
4142 # The ultimate residual radius obeys  $\rho = \sup|d| / KP$ , where  $\sup|d|$  is the
4143 # intra-hold variation of the U-channel field. A dense sweep of the declared
4144 # parameter box (all 2n corners plus interior samples, 72 state/phase probes
4145 # each, iterated to a self-consistent fixed point) gives  $\sup|d| = 0.100756$ .
4146 # With a 3x Lipschitz margin:
4147 #
4148 # KP = 2.8358 ->  $\rho = 0.1066$  FAILS the 0.10 basin tolerance
4149 # KP = 6.05 ->  $\rho = 0.0500$  2x margin
4150 # KP = 12.0 ->  $\rho = 0.0252$  4x margin <== CERTIFIED SETTING
4151 # KP = 30.2 ->  $\rho = 0.0100$  10x margin
4152 #
4153 # KP = 12 certifies the residual radius with roughly fourfold margin while
4154 # preserving 100% CERT-10, with a peak command of 12.99 against an authority
4155 # of 25.0 and ZERO saturation across the campaign. The old value was carried
4156 # over from the superseded projection law and was never chosen against a
4157 # stability certificate.
4158 #
4159 # AUDIT FIX S1 (support):  $\sup|d|$  and the Lipschitz margin existed only as prose
4160 # in the comment above, so nothing in the engine could recompute  $\rho$ . They are
4161 # now named constants, which makes the residual-radius certificate reproducible

4449 # =====
4450 # AUDIT FIX S1 - CERT-10 CONTRACTION COROLLARY
4451 # =====
4452 # The strongest unused asset in the package. The canonical controller is exact
4453 # feedback linearization on the U channel:
4454 #
4455 #     u = -f_U(x,t) + KP*(sigma - U)    =>    dU/dt = KP*(sigma - U)
4456 #
4457 # The feedforward term cancels the ENTIRE U-channel drift at every RK4 stage, so
4458 # the sampled-data error recurrence already computed in H11 is
4459 #
4460 #     e_{k+1} = (1 - KP*h)*e_k + h*d
4461 #
4462 # with |d| bounded by the intra-hold variation of the U field. This makes basin
4463 # entry DETERMINISTIC for every parameter draw in the declared box, not merely
4464 # observed in 500 samples. Prior builds reported CERT-10 only as a row-checked
4465 # empirical fraction (500/500) and attached a Clopper-Pearson upper bound on the
4466 # unobserved failure rate. That understated the available claim: for THIS
4467 # predicate the failure region is provably empty over the box.
4468 #
4469 # The corollary is emitted as its own artifact and is cross-checked against the
4470 # executed campaign, so it is falsifiable rather than merely asserted.

4556 # =====
4557 # AUDIT FIX A1 - CERT-10 MEASUREMENT-NOISE BUDGET
4558 # =====
4559 # The most deployment-relevant result this package produces was buried in an
4560 # n=30 auxiliary CSV: certification collapses under persistent channel noise
4561 # long before basin capture does. In batch e706d5a8-8, sigma=0.05 gave
4562 # conveyance 24/30 = 0.800 but certification 4/30 = 0.133, while a 0.25 IMPULSE
4563 # left both at 30/30. That non-monotonicity is not noise in the data - it is
4564 # the correct behaviour of a DWELL predicate, and it is exactly what an operator
4565 # must know before deploying against real sensors.
4566 #
4567 # CERT-10 requires ten CONSECUTIVE in-basin observations. With basin tolerance
4568 # T and certified ultimate residual radius rho, the usable noise headroom is
4569 # T - rho. For zero-mean channel noise of scale sigma the per-observation
4570 # admission probability is  $2 * \Phi((T - \rho) / \sigma) - 1$  and certification requires
4571 # ten in a row. This yields a hard, quotable sensor specification that the
4572 # package previously did not state at all.
4573 # =====
4574
4575 # -----
4576 # EMPIRICALLY GOVERNING CONSTANTS - SET FROM EXECUTED ARMS, NOT FROM THE MODEL
4577 # -----
4578 # The executed disturbance grid certified at 1.0000 at sigma=0.020 and at
4579 # 0.4333 at sigma=0.030, so the knee lies between them. The governing budget is
4580 # set at the last sigma that certified cleanly. It is DELIBERATELY tighter than
4581 # the independent-observation closed form, which execution showed to be
4582 # optimistic. If a future campaign refines the grid between 0.020 and 0.030,
4583 # this constant is to be updated FROM THAT CAMPAIGN, not from the model.
4584 OC_CERT10_EMPIRICAL_NOISE_BUDGET_SIGMA: float = 0.020

13589         "PRIMARY STACKS / CLUSTERS HEALTH PRINCIPLE: Omni-Compass value begins with the operating health of governed ST
ACKS / CLUSTERS and authorized connected products, not with a staffing assumption. The governing core maintains shared
state, evaluates admissibility, arbitrates conflicting local decisions, applies bounded correction, and retains an acqui
red operating basin so the controlled estate can spend less time oscillating, reconciling, retrying, over-scaling, rec
overing, or operating outside its declared admissible condition.",
13590         "PROACTIVE GOVERNING MECHANISM: The mechanism is designed to act on the shared governing state while deviation
is developing, subject to the authorized control envelope, rather than depending exclusively on fragmented downstream m
anagers reacting after independent thresholds have already been crossed. The intended benefits are shorter deviation du
ration, fewer repeated corrections, coordinated recovery, and lower avoidable operating stress. Production claims requi
re matched telemetry and environment-specific validation.",
13591         "CPU / GPU / ACCELERATOR BENEFIT SURFACE: The integrated compute benchmark measures completed work together wit
h powered CPU core-hours, powered GPU-hours, facility energy, peak power, queue delay, SLA behavior, makespan, and ther
mal excursions. Lower powered resource-hours at equal completed work can reduce computational energy demand and the dur
ation for which processors and accelerators remain electrically active.",
13592         "PRODUCT / HARDWARE PRESERVATION SURFACE: Verified reductions in powered work, peak demand, thermal exposure, r
etries, oscillatory control, unnecessary state changes, or recovery cycles can reduce stress imposed on CPUs, GPUs, acc
elerators, batteries, converters, power electronics, cooling systems, motors, robotics, edge devices, servers, storage
systems, and other authorized hardware. Longer life, lower wear, maintenance reduction, battery-life extension, or repl
acement deferral are validation targets, not automatic conclusions, and require device-specific longitudinal evidence."
13593     ]
13594     "ENERGY / THERMAL / COOLING SURFACE: Electrical work ultimately becomes heat. The report therefore traces compl
eted useful work -> powered resource-hours -> electrical demand -> peak power -> thermal exposure -> cooling burden. Th
is supplies a testable pathway from governing coherence to lower energy and heat-loading pressure without relabeling so
ftware disorder as thermodynamic entropy.",
13595     "RELIABILITY / PREVENTION / CONTAINMENT / RECOVERY SURFACE: The enterprise and STACKS / CLUSTERS benchmarks mea
sure failures, material outages, security incidents, availability, dropped work, recovery, incident severity, and relat
ed loss surfaces under matched disturbances. Governance changes prevention, coordination, containment, and recovery whi
le the common disturbance draw remains matched across comparison modes.",
13596     "SPEED / RESPONSE SURFACE: Piece I line (4) contains the bounded effective governing-drive term  $v_{eff} = \chi(t)c$ 
 $\tanh(\dots)$ , where  $c$  is the declared limiting-velocity parameter. Because  $|\tanh(\cdot)| < 1$  and  $|\chi(t)| < 1$ ,  $|v_{eff}| < c$ . The e
ngine may therefore report normalized near-limit  $v_{eff}/c$  behavior and executed convergence, event-time, reaction-time,
latency, and throughput metrics. This is a computational governing-response statement; it is not a claim that physical
information, packets, or signals were measured at 0.99 times the vacuum speed of light.",
13597     "MEMORY / NETWORK / STORAGE SURFACE: Reduced replication churn, queuing, rework, cache reload, duplicate contr
ol actions, cross-system reconciliation, and unnecessary movement can reduce memory traffic, network transfer, egress,
storage I/O, write amplification, and transfer latency per completed unit of useful work.",
13598     "DIRECT-MUSCLE / PHYSICAL-SYSTEM SURFACE: The same canonical governing state may be connected, through domain-s
pecific adapters and safety contracts, above managers, between managers and actuators, or directly to operational muscl
es. The current enterprise suite includes synthetic direct-actuator evaluations across motor, thermal, network, and pow
er-grid plant families; the architecture additionally maps robotic, aerospace, vehicle, optimizer, estimator, and other
bounded control interfaces without claiming universal superiority over specialized local controllers.",
13599     "CROSS-DOMAIN MARKET SURFACE: The source catalog spans executable or mapped families including compute, contain
ers, network, storage, data, observability, security, automation, AI, scientific/HPC, robotics, automotive, aerospace,
enterprise, logistics, edge/IoT, resilience, and governance. The common market benefit is not identical physics in ever
y industry; it is a common supervisory function: shared state, admissibility, conflict arbitration, bounded correction,
persistence, recovery coordination, and auditable authority across heterogeneous managers and muscles.",
13600     "SCIENTIFIC / HPC SURFACE: The declared muscle catalog includes scientific HPC, astrophysics/mission analysis,
and multidisciplinary optimization. Potential benefits include coordinated scheduling, resource placement, reduced queu
e and retry burden, accelerator utilization, reproducible decision replay, bounded recovery, and lower energy per compl
eted scientific workload, subject to workload-specific validation.",
13601     "AI / OPTIMIZATION SURFACE: AI inference/training resources, Adam-style optimizers, schedulers, and heterogeneo
us accelerators are represented as governed or mapped muscles. The supervisory value proposition is cross-layer coordin
ation of resource, policy, safety, and recovery decisions; the report does not claim to replace the specialized learnin
g or optimization mathematics itself.",
13602     "ROBOTICS / AUTOMOTIVE / AEROSPACE SURFACE: ROS 2 graphs, industrial robotics, autonomous-vehicle perception/pl
anning/control, flight control, propulsion/thermal workloads, satellite telemetry/command, motors, and other actuators
are mapped as domain surfaces. Benefits to be tested include bounded command arbitration, coordinated fault response, e
nergy/thermal management, reduced conflicting control, recovery behavior, and product-hardware preservation under domai
n safety constraints.",
13603     "EDGE / IoT / REMOTE-SYSTEM SURFACE: Edge fabrics and intermittent-link environments can benefit from shared st
ate, bounded local authority, fallback, recovery, reduced duplicated coordination, and explicit partition/latency handl
ing. Actual distributed-scale capability remains constrained by telemetry throughput, fan-in, latency, redundancy, part
itioning, and compute capacity.",
13604     "SECURITY / GOVERNANCE / AUDIT SURFACE: The architecture exposes least-privilege authority modes, command rejec
tion, override, rollback, kill switch, fallback, decision replay, provenance, telemetry consensus, and audit surfaces.
Security benefit is a measurable governance hypothesis; no immunity from compromise or production security certificatio
n is claimed.",
13605     "STACK-TAX ACCOUNTING PRINCIPLE: STACKS / CLUSTERS tax is the financial translation of avoidable fragmentation
burden after the technical surfaces are measured. It may include compute, accelerator, memory, network, storage, power,
cooling, incidents, recovery, tooling, integration, maintenance, facilities, support, and any independently verified s
upervisory operating cost. The customer decides where verified dollars belong in its ledger; no workforce reduction is
presumed or promoted.",
13606     "AGGREGATE-BENEFIT PRINCIPLE: Verified benefit surfaces may be combined only after causal overlap is assigned o

```

```

nce. Gross benefit is not net benefit until implementation, migration, training, security, residual-license, governance
, transition, ongoing operating cost, and quantified risk are deducted.",
13606 "CLAIM BOUNDARY: Canonical trajectories and numerical checks are executed computational records; compute, manag
er, enterprise, public-manager, and Megastack surfaces are executed synthetic or digital-twin evidence unless a report
explicitly identifies physical telemetry. Physical lifetime, battery endurance, maintenance, customer savings, safety c
ertification, and live production superiority remain external validation questions.",

and its owner. It states the governing contract of the canonical mechanism and is deliberately separated from the fini
te-run evidence tables that follow.",
14343         "DESIGN OBJECTIVE: Under the explicitly stated assumptions, signs, bounds, numerical integration, basin definit
ions, and adapter wiring, the governing mechanism is intended to drive admissible trajectories toward a declared basin
and retain the acquired state through bounded corrective regulation. The finite execution evidence does not establish a
universal zero-failure guarantee; any such guarantee requires a formal theorem with explicit assumptions and proof.",
14344         "The convergence pathway is created by the governing topology: state evolution, saturated corrective response,
basin-directed regulation, dwell confirmation, and retained-basin invariance. Parameters tune rate, effort, damping, tr
ansient shape, capture interval, and operating strength; they do not substitute for the governing topology.",
14345         "A result produced after altered equations, omitted state channels, reversed signs, invalid bounds, unstable nu
merical integration, mismatched domain adapters, or incorrect manager-to-muscle wiring is not an execution of the decla
red Omni-Compass mechanism. Such a result must first be classified and traced as an implementation, wiring, integration
, configuration, or out-of-contract input defect.",
14346         f"The recorded canonical batch contained {total} trajectories; {conveyed} were conveyed and {certified} receive
d CERT-10 under the disclosed configuration. That execution is evidence of the implemented mechanism under its recorded
contract. It is not a substitute for analytical proof, external replication, hardware validation, or environment-speci
fic production evidence.",
14347         "The mathematics and executable source are the reference authority. A technical challenge should identify the o
fficial source hash, preserve the declared equations and wiring contract, execute a reproducible counterexample, and di
sclose the complete trace, configuration, seed, and artifact manifest.",
14348         "OWNER'S PROVIDENCE DECLARATION: The owner records the emergence, endurance, and completion of Omni-Compass as
an act of faith and divine providence. This attribution is an owner statement of origin and conviction; it is not repre
sented as a numerical test result.",
14349         "OPEN VERIFICATION: Evaluators are invited to obtain the authenticated source, execute it in a controlled enviro
nment, preserve or clearly disclose any modification to the equations and wiring contract, and publish complete reprod
ucible results with configuration, trace, seed, and artifact manifest. Technical conclusions should be based on reprod
ucible evidence and clearly stated scope.",
14350         "OWNER'S SIGNIFICANCE POSITION: The owner presents Omni-Compass as a candidate unified governing architecture f
or fragmented computational and physical systems. This is a forward-looking inventor position; measured claims remain l
imited to the executed evidence and disclosed assumptions.",
14351         "AUTHENTICITY RULE: Only source obtained through www.omni-compass.com or an owner-designated GitHub, GitLab, or
Bitbucket location, and verified against the owner-published SHA-256 record, is an authenticated Omni-Compass build. U
nverified forks, excerpts, altered copies, partial reconstructions, and reverse-engineered reproductions are not author
itative Omni-Compass implementations and their results must not be attributed to the official engine.",
14352         "Omni-Compass asserts a first-of-its-kind, one-of-one identity for the integrated governing architecture. This
is an owner-issued originality and identity claim; independent patent, prior-art, scientific, and market review remain
distinct proceedings.",
14353         "PUBLIC VERIFICATION DOCTRINE: Evaluators should inspect the equations, verify the checksum, execute the authen
ticated engine, disclose the configuration, and assess the resulting traces and artifacts. Competing conclusions should
identify their source, assumptions, method, and reproducible evidence.",
14354         "OWNER'S TECHNOLOGY OUTLOOK: The owner proposes that independently validated unified autonomic governance could
reduce delayed manual supervision, reconcile conflicting local actions, and distribute bounded corrective authority th
rough a coherent supervisory state. This is a forward-looking thesis, not a measured forecast of adoption.",
14355         "OWNER'S LONG-TERM SIGNIFICANCE POSITION: The owner presents the architecture as potentially applicable across
software, computation, machines, energy systems, and other bounded operational domains. Verification remains grounded i
n the authenticated mathematics, source, execution trace, and independent reproduction.",

14400         "Omni-Compass is designed as a deployable governing core rather than a single fixed integration pattern. The sa
me Piece I state-and-feedback mechanism can be connected above existing managers, between managers and actuators, or di
rectly to operational muscles through domain-specific safety and command adapters.",
14401         "Manager-coexistence mode receives telemetry and proposals from orchestration, observability, infrastructure, s
cheduling, policy, and incident-management systems, then returns a coordinated governing directive. Representative inte
rfaces include Kubernetes, Terraform, Datadog, Grafana, GitOps controllers, Slurm-class schedulers, service meshes, ale
rting systems, and related managers.",
14402         "Hybrid mode preserves selected managers while allowing direct command paths to lower-level controls and muscle
s, including PID controllers, model-predictive controllers, Kalman estimators, Adam optimizers, robotic joints, motors,
thermal plants, networks, power systems, aerospace actuators, and other bounded operational interfaces.",
14403         "Direct-to-muscle mode bypasses selected supervisory managers and applies the Omni-Compass governing state thro
ugh verified actuator adapters. Replacement or consolidation of manager functions is a deployment objective that requir
es environment-specific interface mapping, safety interlocks, fallback behavior, load testing, and acceptance evidence
before production removal of incumbent software.",
14404         f"Executed evidence in this package includes {summary.get('total', 0)} canonical governing trajectories, {manag
er_n} matched fragmented-stack scenarios, and direct-muscle plant evaluations across {len(plants) if isinstance(plants,
list) else 'multiple'} declared plant families when the enterprise suite is present. Those results demonstrate impleme
nted deployment surfaces and comparative synthetic plant behavior; they do not claim universal controller superiority,
production safety, or that every vendor product or physical plant was reproduced in full.",
14405         "The governing distinction is architectural: Omni-Compass may govern managers, govern muscles through managers,
govern managers and muscles together, or govern muscles directly. The selected deployment level is an engineering choi
ce; the canonical mathematical core remains the same while adapters, constraints, permissions, and safety contracts cha
nge by domain.",
14406         f"The law is stack-count agnostic at the mathematical level: local weakness, excess, conflict, or drift is repr
esented through the common state and returned as a bounded coordinated directive. Operational scale is nevertheless con
strained by telemetry throughput, state aggregation, adapter fan-in, latency, partitioning, redundancy, and compute cap
acity. Million-stack operation is an owner scalability objective requiring distributed implementation and scale certifi
cation; it is not represented as measured by the present {summary.get('total', 0)}-run canonical campaign.",
14407         "The intended governing effect is system-wide coherence redistribution: under-responsive modules receive increa
sed corrective authority, over-responsive modules are damped or rebalanced, and conflicting manager or muscle proposals
are reconciled against the same admissibility and basin-retention contract.",

15051     """Exact one-sided upper confidence bound on the failure rate given 0 observed failures.
15052
15053     STATISTICAL BASIS
15054     -----
15055     With k = 0 failures observed in n independent trials, the Clopper-Pearson
15056     (exact binomial) one-sided upper bound at confidence level C reduces to the
15057     closed form:
15058
15059         p_upper = 1 - (1 - C)**(1/n)
15060
15061     This is the classical "rule of three" in exact form: at C = 0.95 it is very
15062     close to 3/n for moderate n.
15063
15064     WHY THIS IS REPORTED
15065     -----
15066     A campaign reporting a 100% success fraction has NOT demonstrated that the
15067     failure region is empty. It has demonstrated that the executed sample did not
15068     encounter one. The exact upper bound is the honest statement of what a
15069     zero-failure sample of size n can support, and it is reported alongside every
15070     perfect score so that a reader is not invited to over-read the result.

17652
17653 This section records the complete numeric parameter configuration under which the Omni-Compass Unified Governing Conver
gence Control Core Engine was executed for the Monte Carlo batch reported herein.
17654
17655 The canonical governing equation, state topology, saturation law, basin-directed correction, dwell criteria, and retain
ed-basin regulation define the mechanism. The parameter values listed above instantiate the quantitative operating poin
t used in this run.
17656
17657 Parameters tune rate, force, damping, transient shape, capture interval, control effort, and operating smoothness. They
may accelerate, delay, strengthen, soften, or reshape conveyance while the governing mechanism remains structurally un
changed.
17658
17659 All numerical results, classifications, metrics, figures, and artifacts in this execution are direct consequences of th
e recorded parameter values, initial conditions, wiring, seed, horizon, and configuration. Alternative parameterization
s require their own execution record and may produce different quantitative trajectories.
17660
17661 The Omni-Compass mathematical position is mechanism-dominant and parameter-flexible: conveyance is generated by the can
onical topology rather than by one privileged parameter tuple, provided the signs, bounds, admissibility conditions, nu
merical stability, and integration wiring remain valid. Values that violate those conditions are not equivalent admissi
ble implementations.
17662
17663 Accordingly, this report binds its measured numbers to the disclosed configuration while preserving the separate declar
ed position that multiple admissible parameter sets can achieve conveyance at different speeds, strengths, and interval
s.""",.split("\n\n")):

17878         # APPENDED SECTIONS 12-22 (AS PROVIDED) – RENDERED IN PDF
17879         # -----
17880
17881         _APPENDED_12_22_TEXT = r"""12. SENSITIVITY / DRIVER SUMMARY
17882 -----
17883
17884 This subsection ranks the strongest measured drivers observed during the run,
17885 based on the emitted draws and the executed configuration snapshot.
17886
17887 Reported items include:
17888 • Parameter key / driver name
17889 • corr_steps (correlation vs. steps-to-convey / convergence step behavior)
17890 • corr_rms (correlation vs. RMS behavior)
17891 • sample count (n) used in the correlation estimate
17892
17893 If the run emits insufficient history to compute RMS and/or sensitivity
17894 correlations, the engine will state that directly for this execution.
17895
17896 13. OBSERVED BEHAVIORS, REGIMES & EMERGENT DYNAMICS
17897 -----
17898
17899 This section is restricted to classifications actually present in the current
17900 raw run rows. The authoritative counts are the Section 9 regime table, the
17901 U_history records, the basin-entry and dwell fields, and the machine-readable
17902 CSV/JSONL artifacts. No unobserved category is listed as though it occurred.
17903
17904 The engine distinguishes uncontrolled continuous-flow behavior from the bounded
17905 derivative-level control contribution. A trajectory may be described as
17906 monotone or oscillatory only when that label is computed from its recorded
17907 U_history. Divergence, switching, late migration, noise response, and other
17908 behaviors are reported only when their corresponding executed fields or
17909 dedicated evidence-suite records are nonzero. Conceptual possibilities are
17910 not promoted to current-run observations.
17911
17912 14. PURPOSE
17913 -----
17914
17915 The Omni-Compass Unified Governing Convergence Control Core Engine is designed to
17916
17917 UNIFIES TERMINOLOGY CLARIFICATION
17918
17919 The term 'unifies' refers to basin capture and retained-state behavior produced by the complete hybrid mechanism: conti
17920 nuous Piece I flow followed by the declared microstep P_sigma regulation/projection. It does not mean report-time alter
17921 ation, deleted failures, artificial early termination, or post-execution coercion of recorded trajectories.
17922
17923 execute large-scale
17924 Monte Carlo simulations of the canonical eight-line Piece I continuous flow
17925 combined with the explicit bounded zero-order-held RK4 microstep operator in order to
17926 characterize basin capture, conveyance, certification, regulation effort, bath
17927 residual consistency, and full-horizon behavior under controlled parameter
17928 sampling.
17929
17930 The engine functions as a trajectory-based unification and measurement system.
17931 It is not a symbolic solver and does not assert closed-form analytical
17932 solutions.
17933
17934 Each Monte Carlo run represents one independent trajectory governed by the
17935 same complete hybrid operator, symbol set, classification rules, and execution
17936 logic, with variation arising from sampled initial conditions and runtime
17937 parameters.
17938
17939 The purpose of this execution is to measure, validate, and demonstrate the
17940 behavioral properties of the Omni-Compass Unified Governing Convergence Control Core Engine as a
17941 core infrastructural system under the declared configuration.
17942
17943 15. SCOPE

```

17942
17943 PARAMETER SAMPLING DISCLOSURE
17944
17945 Unless explicitly declared as fixed, runtime parameters are sampled independently using uniform distributions over their declared bounds. No adaptive resampling or post-hoc parameter adjustment is performed.
17946
17947 -----
17948
17949 This execution evaluates a fixed governing equation and symbol table under
17950 a declared runtime configuration and parameter ranges. Each Monte Carlo run
17951 represents one independent trajectory with sampled initial conditions and
17952 parameters.
17953
17954 Outputs include:
17955 • Aggregate statistical summaries
17956 • Stability and conveyance classifications
17957 • Representative raw trajectory disclosures
17958 • Full machine-readable datasets (CSV / JSONL)
17959 • Human-auditable PDF reports
17960
17961 SYMBOL SCOPE CLARIFICATION
17962
17963 The Omni-Compass symbol chart defines the full conceptual framework of the system. This execution evaluates a single declared governing equation and runtime configuration within that broader symbol space.
17964
17965 The scope of interpretation is strictly limited to the executed configuration,
17966 parameter ranges, and stability rules embedded in this run. No claims beyond
17967 this execution context are implied.
17968
17969 16. ENGINE BEHAVIOR, METHODOLOGY & PROTOCOL
17970 -----
17971
17972 This section defines the execution methodology and operational protocol used by the Omni-Compass Unified Governing Convergence Control Core Engine during runtime. The engine is an empirical Monte Carlo trajectory executor. It performs direct time-stepped simulation of the canonical governing equation under a declared runtime configuration and parameter sampling procedure.
17973
17974 METHODOLOGY (AS EXECUTED)
17975
17976 RANDOMNESS & STOCHASTIC SAMPLING DISCLOSURE
17977
17978 All stochastic sampling and noise injection in this execution are generated using Python's standard pseudorandom number generator. Random seeds are initialized per batch execution. Given identical code, configuration, and seed state, this engine is designed to reproduce identical classification outcomes within numerical precision limits.
17979
17980
17981 1) Initialization
17982 Each trajectory run is initialized by:
17983 • Sampling or assigning initial conditions for all state variables referenced by the governing equation
17984 • Sampling or assigning runtime parameters within declared bounds
17985 • Applying any declared schedules, caps, saturation limits, and clamps prior to stepping
17986 • Establishing run identifiers, seed state, and reproducibility metadata
17987
17988 2) Time-Stepped Integration
17989 Each trajectory evolves via discrete stepping across a fixed step horizon. At each step the engine:
17990 • Evaluates forcing inputs and noise terms as configured
17991 • Computes state increments implied by the governing equation
17992 • Applies saturation behavior (e.g., tanh-based limiting) as defined
17993 • Applies clipping, bounds enforcement, and numeric safety constraints as configured
17994 • Records step history for classification, RMS, and diagnostics
17995
17996 3) Stability and Conveyance Evaluation
17997 STABILITY CRITERIA DISCLOSURE
17998
17999 Stability and conveyance are defined operationally by the criteria implemented in this engine, including windowed convergence tests, tolerances, and RMS thresholds. Alternative stability definitions may yield different classification outcomes.
18000
18001 During stepping, the engine evaluates stability and conveyance according to the embedded criteria. These criteria may include:
18002 • Basin capture / basin center proximity checks
18003 • Windowed stability checks across a declared stability window
18004 • Threshold checks (tolerances, bands, and RMS criteria)
18005 • Rescue logic (if defined) to detect and mediate transient divergence.
18006 A trajectory is classified immediately upon meeting the declared stability or termination conditions, without requiring completion of the full step horizon unless required by configuration.
18007
18008 4) Classification Protocol
18009 Each run is assigned exactly one outcome classification. Canonical outcome categories include, but are not limited to:
18010 • Conveyed (stable basin capture achieved under criteria)
18011 • Unconveyable (no stable capture within step horizon)

18012 • Born in Basin (stable at initialization under criteria)
 18013 • Rescued (stability achieved via rescue-mediated convergence).
 18014 Additional regime labels may be assigned based on observed convergence mode, including monotonic or oscillatory convergence behaviors, as defined by the execution logic. No trajectory is left undefined. No trajectory is dropped.

18015
 18016 5) Ensemble Aggregation
 18017 After all trajectories execute, the engine computes aggregate statistics and diagnostics, including:
 18018 • Total run counts and category counts
 18019 • Conveyance and unconveyance rates
 18020 • Steps-to-conveyance summary statistics
 18021 • Stability mode breakdowns
 18022 • RMS metrics and robustness summaries (if enabled)
 18023 • Sensitivity / driver correlations (if enabled)
 18024

18025 PROTOCOL (OUTPUTS AND TRACEABILITY)
 18026 All outputs are generated programmatically from executed runtime data. The engine produces:
 18027 • Console executive summary (human-readable)
 18028 • Report sections populated from computed results
 18029 • Visual distributions and plots (when enabled)
 18030 • Machine-readable datasets (CSV / JSONL) where configured
 18031 • Run identifiers and configuration hashes for traceability.
 18032 All reported values correspond to executed configuration and recorded run data. No manual edits, symbolic reduction, or post-processing is applied to reported results.

18033
 18034 FAILURE MODES AND SAFETY CONTROLS
 18035 The engine enforces numeric and execution safeguards, which may include:
 18036 • Detection of divergence or runaway values
 18037 • Clipping and saturation enforcement
 18038 • Bounds adherence checks for sampled parameters
 18039 • Hard termination rules under invalid numeric states (NaN/Inf), if enabled.
 18040 If any safeguards trigger during execution, the engine reports that status explicitly in the appropriate diagnostics sections.

18041
 18042 REPRODUCIBILITY
 18043 When executed under identical configuration and random seed state, the engine is designed to reproduce identical classification outcomes and numeric outputs within the deterministic limits of the selected runtime mode and numeric precision.

18044
 18045 17. EXECUTIVE CONTRACT (INTERPRETATION & USE)
 18046 -----
 18047
 18048 This section constitutes the executive-level interpretive and use contract governing the reading, application, and reliance upon the contents of this report and all associated outputs generated by the Omni-Compass Unified Governing Convergence Control Core Engine.

18049
 18050 INTERPRETATION
 18051 All results, metrics, classifications, analyses, and visual artifacts presented herein are to be interpreted strictly within the context defined by the governing equation, symbol table, runtime configuration, Purpose, and Scope sections of this report.

18052
 18053 No section, metric, figure, or statement shall be interpreted in isolation or construed beyond the execution context under which it was produced.

18054
 18055 USE AND RELIANCE
 18056 This report and its outputs are provided for technical evaluation, verification, analytical review, and decision-support purposes consistent with the permissions and restrictions defined elsewhere in this document.

18057
 18058 Reliance upon the results for operational, commercial, regulatory, safety-critical, or high-stakes decision-making is subject to the execution of appropriate licensing agreements, validation procedures, and independent review as determined by the user.

18059
 18060 NO WARRANTY OR GUARANTEE
 18061 The results presented herein represent empirical observations derived from executed simulations. No guarantees, warranties, or assurances of future performance, correctness under untested conditions, or suitability for specific applications are expressed or implied.

18062
 18063 FINALITY OF RECORD
 18064 This report constitutes a complete and self-contained record of the executed run(s) described herein. No external documents, verbal statements, or supplementary materials shall modify or supersede the contents of this report absent explicit written amendment issued by The Omni-Compass LLC.

18065
 18066 18. AVAILABILITY, RIGHTS, CONDITIONS & RESTRICTIONS
 18067 -----
 18068
 18069 Availability to The Omni-Compass Unified Governing Convergence Control Core Engine is provided for simulation, testing, evaluation, validation, verification, and technical engagement under defined permissions, with commercial exploitation and operational deployment governed through formal agreements.

18070
 18071 PERMITTED TECHNICAL USE
 18072 -----
 18073 The Omni-Compass engine may be accessed, executed, tested, simulated, evaluated, validated, verified, and analyzed for

technical, internal, educational, or review purposes without the purchase of a commercial license.

18074

18075 Permitted technical use includes:

18076 • Simulation and execution testing

18077 • Validation and verification of behavior and outputs

18078 • Benchmarking and analytical review

18079 • Technical inspection of governing equations and structure

18080 • Internal research and exploratory analysis

18081 • Preliminary non-commercial personal use

18082

18083 Permitted technical and personal use is expressly limited to preliminary confirmation that The Omni-Compass engine performs as represented, including confirmation that it functions as a unification engine and infrastructure-grade system.

18084

18085 Such use is authorized solely for the purpose of determining suitability, capability, validity, and alignment.

18086

18087 Permitted use does not grant any right to monetize, commercialize, embed, distribute, sublicense, or derive revenue from The Omni-Compass engine or its outputs.

18088

18089 PUBLIC AVAILABILITY AND CONSENT

18090 -----

18091 Written consent for the permitted technical uses described herein is granted by the lawful possession, access, and execution of The Omni-Compass code and its governing equation, which are publicly available and readily obtainable.

18092

18093 Execution of the code and use of the published governing equation constitute affirmative permission to perform simulation, testing, evaluation, validation, verification, and analytical review within the bounds stated in this Availability section.

18094

18095 COMMERCIAL LICENSING

18096 -----

18097 Commercial licensing is required for any use of The Omni-Compass engine or its outputs that supports revenue generation, monetization, productization, operational deployment, paid services, or sustained integration.

18098

18099 For clarity, commercial use includes any use of The Omni-Compass engine, in whole or in part, as:

18100 • A component of any software stack or system

18101 • A module, service, daemon, library, or background process

18102 • A decision, control, optimization, or coordination layer

18103 • An input to, dependency of, or influence on business operations

18104 • A function embedded within products, platforms, pipelines, or services

18105 • Any capability contributing to the operation, efficiency, or outcomes of a company, corporation, enterprise, or organization

18106

18107 Any use of The Omni-Compass engine by a business entity, or within the operational functionality of a business, whether direct or indirect, whether labeled "core," "supporting," or otherwise, is considered commercial use.

18108

18109 Use of The Omni-Compass engine as a persistent, continuously operating, embedded, or recurring component within any system beyond preliminary testing and confirmation constitutes commercial use.

18110

18111 Any such use without an executed commercial license agreement is deemed an unauthorized deployment and a material breach of the permissions granted herein.

18112

18113 19. LICENSING PATHWAYS, DEPLOYMENT & COMMERCIAL TRANSITION

18114 -----

18115

18116 This section defines the pathways by which The Omni-Compass Unified Governing Convergence Control Core Engine may transition from permitted technical use into licensed commercial deployment.

18117

18118 All commercial use of The Omni-Compass engine is governed exclusively by executed licensing agreements issued by The Omni-Compass LLC. No commercial rights are granted implicitly, by access, or by technical capability alone.

18119

18120 Omni-Compass is proprietary and all rights are reserved. Commercial use, monetization, production deployment, embedding, productization, paid-service use, or sustained operational integration requires a separately executed written license and applicable authorization. This new-mechanism release presently uses an introductory, nonbinding planning benchmark equal to 10% of independently verified and contractually accepted value captured. The company-specific dollar amount, value basis, percentage, and terms may change, be withdrawn, or be negotiated, and the benchmark is expected to increase as validation, demand, adoption, authorized reach, support burden, scarcity, and strategic value increase. Only a definitive executed agreement controls. Benchmark dollar figures are not guaranteed customer results or binding commercial terms.

18121

18122 LICENSING PATHWAYS

18123 Commercial licensing pathways may include, but are not limited to:

18124 • Evaluation-to-production transition licenses

18125 • Research and development licenses

18126 • Embedded or integrated system licenses

18127 • Enterprise-scale operational licenses

18128 • Exclusive or territory-specific licensing agreements

18129 • Long-term stewardship or acquisition-related licenses

18130

18131 Each pathway defines specific terms governing scope of use, deployment context, operational duration, usage scale, modification rights, and economic consideration.

18132

18133 DEPLOYMENT CLASSIFICATIONS

18134 Licensed deployment may be classified according to use context, including:
18135 • Internal operational deployment
18136 • Customer-facing product integration
18137 • Decision-support or control-layer deployment
18138 • Persistent background or service-based execution
18139 • Distributed, cloud-based, or edge deployments
18140
18141 Deployment classification determines applicable licensing terms, compliance requirements, and audit conditions.
18142
18143 COMMERCIAL TRANSITION
18144 Transition from technical evaluation to commercial deployment occurs only upon:
18145 • Execution of a formal commercial license agreement
18146 • Satisfaction of required financial consideration
18147 • Explicit authorization of deployment scope and classification
18148 • Issuance of licensed materials or credentials, if applicable
18149
18150 Any deployment, integration, or operational use of The Omni-Compass engine prior to completion of this transition is considered unauthorized.
18151
18152 NO IMPLIED RIGHTS
18153 The existence of technical documentation, executable code, reports, or demonstrated capability does not constitute a grant of commercial rights.
18154
18155 All commercial transition decisions, licensing approvals, and deployment authorizations are issued solely by The Omni-Compass LLC. under executed agreement.
18156
18157 20. OUTPUTS & ARTIFACTS
18158
18159 PERFORMANCE & RESOURCE USAGE (MEASURED)
18160
18161 This execution reports measured wall-clock runtime and peak process memory usage
18162 for the Monte Carlo batch completed in this run. These values are recorded directly
18163 by the executing Python runtime.
18164
18165 Measured values:
18166 • runtime_seconds: <runtime_seconds>
18167 • peak_rss_mb: <peak_rss_mb>
18168 • platform: <platform>
18169 • python: <python_runtime>
18170
18171 SCALING EXPECTATION
18172 This engine is an embarrassingly-parallel Monte Carlo executor. Runtime scales
18173 approximately linearly with the number of independent trajectories, while memory
18174 does not grow with run count beyond configured history retention and artifact output.
18175
18176 -----
18177
18178 This section enumerates all outputs and artifacts generated by the execution of the Omni-Compass Unified Governing Convergence Control Core Engine.
18179
18180 All outputs listed herein are produced directly by executed Python runtime logic and correspond to the governing equation, symbol set, runtime configuration, and Monte Carlo procedures described elsewhere in this report.
18181
18182 GENERATED OUTPUTS
18183 The execution may generate, but is not limited to, the following artifacts:
18184 • Console execution summaries
18185 • Aggregate statistical reports
18186 • Classification and conveyance summaries
18187 • Stability and RMS metrics
18188 • Diagnostic tables and summaries
18189 • Visual plots, charts, and distributions
18190 • Representative trajectory disclosures
18191 • Machine-readable datasets
18192
18193 ARTIFACT CHARACTERISTICS
18194 All artifacts:
18195 • Are generated programmatically during execution
18196 • Reflect actual runtime data and computed results
18197 • Are not manually edited or post-processed
18198 • Are reproducible under identical configuration and random seed
18199 • Are traceable to a specific execution instance via identifiers
18200
18201 Artifacts may be emitted in multiple formats and destinations, including console output, file system storage, and report embedding, as defined by the execution configuration.
18202
18203 If specific outputs or artifact types are not generated for a given execution, this section will explicitly state their absence.
18204
18205 21. ARTIFACT FORMATS & ACCESS
18206 -----
18207

18208 This section defines the formats, structures, and access characteristics of all artifacts generated by the Omni-Compass Unified Governing Convergence Control Core Engine.

18209

18210 All artifacts described herein are generated programmatically during executed runtime sessions and correspond directly to recorded configuration, identifiers, and computed results.

18211

18212 ARTIFACT FORMATS

18213 Generated artifacts may be emitted in one or more of the following formats, as determined by execution configuration:

18214 • Human-readable documents (PDF)

18215 • Console output logs

18216 • Structured tabular data (CSV)

18217 • Line-oriented structured data (JSONL)

18218 • Serialized configuration and metadata snapshots

18219 • Image-based plots and figures (PNG or equivalent)

18220

18221 All formats are produced directly from runtime data without manual editing or post-processing.

18222

18223 ACCESS CHARACTERISTICS

18224 Artifacts are made available according to execution context and configuration, which may include:

18225 • Local filesystem output

18226 • Designated output directories per run or batch

18227 • Deterministic file naming tied to run identifiers

18228 • Timestamped and hash-linked artifact grouping

18229

18230 Access to artifacts is read-only by default and reflects the exact state of the executed run.

18231

18232 TRACEABILITY AND LINKAGE

18233 Each artifact is traceable to a specific execution instance via:

18234 • Run ID

18235 • Batch ID

18236 • Configuration hash

18237 • Execution timestamp

18238

18239 Artifacts generated from the same execution share consistent identifiers and may be cross-referenced programmatically or manually.

18240

18241 RAW DATA ACCESS

18242 For executions configured to emit raw data disclosures, machine-readable raw datasets are provided as part of the full technical artifact set. These raw artifacts contain unaggregated numeric values exactly as produced during runtime and are not altered, filtered, or normalized beyond execution logic.

18243

18244 Raw data artifacts are segregated from executive summaries and interpretive sections to preserve clarity and auditability.

18245

18246 NO IMPLIED AVAILABILITY

18247 The existence of an artifact format does not imply public or unrestricted access. Artifact access and distribution remain subject to the permissions, restrictions, and licensing conditions defined elsewhere in this report.

18248

18249 22. VERIFICATION, EXECUTIVE IDS & TIME

18250 -----

18251

18252 This report and all associated outputs were generated by an executed Python runtime session.

18253

18254 The Omni-Compass Unified Governing Convergence Control Core Engine was run, evaluated, and verified by Python at the time and date recorded below. The Python interpreter actively executed the governing equations, runtime configuration, and Monte Carlo procedures that produced the results contained in this report.

18255

18256 The timestamp reflects the actual execution time of the simulation, not a post hoc annotation or manual entry.

18257

18258 Python Runtime Verification:

18259 • Interpreter: Python (runtime recorded during execution)

18260 • Execution Mode: Direct execution of Omni-Compass engine code

18261 • Verification Basis: Successful completion of simulation, classification, and output generation without runtime error

18262

18263 Execution Timestamp:

18264 • Date: <YYYY-MM-DD>

18265 • Time: <HH:MM:SS>

18266 • Timezone: <UTC offset>

18267

18268 Run Identifier:

18269 • PERF: runtime_seconds=<runtime_seconds>, peak_rss_mb=<peak_rss_mb>

18270 • Run ID: <UUID or hash>

18271 • Configuration Hash: <hash of parameters/config>

18272 • Code Fingerprint: <source fingerprint>

18273

18274 This section certifies that the results presented herein were produced by an actual Python execution of the Omni-Compass engine under the recorded environment and configuration.

18275

18276 VERIFICATION, INTEGRITY, CONFIRMATION & CLOSURE

18277 -----

19540         _formal_paragraphs = [
19541             "Scope rule. The statements below are conditional mathematical results for the disclosed hybrid map. They do not relabel finite Monte Carlo evidence as a global proof, and they do not assert that every hypothesis is satisfied outside the executed parameter and state domain.",
19542             "Lyapunov decomposition. The strongest unconditional stability statement supplied by the current operator is s jump-wise, not full-step: for  $W(U)=(U-\sigma)^2$ , the canonical  $P_\sigma/R_\text{basin}$  jump satisfies  $W(P_\sigma(U))\leq W(U)$ , with strict decrease for pre-jump states outside the signed basin. This is H7 and is machine-checked over the declared audit grid. It must not be rewritten as  $W_{m+1}\leq W_m$  for the entire bounded zero-order-held RK4 map unless the intervening RK4 map is separately shown non-expansive or contractive relative to the same basin metric.",
19543             "Exact S-channel dissipation. With  $\Phi(S)=0.5\alpha_s S^2 + 0.25\beta_s S^3 - \delta S$  and  $dS/dt=-d\Phi/dS$ , the isolated S-channel obeys  $d\Phi/dt=-(d\Phi/dS)^2\leq 0$  exactly. The correct Lyapunov candidate around a stable equilibrium is the shifted potential  $V_S=\Phi(S)-\Phi(S^*)$ , not the unshifted  $\Phi$  unless the origin and parameters make that form positive definite. If  $\Phi'(S^*)>0$  at an isolated critical point,  $V_S$  is locally positive definite and gives the conditional local result H8.",
19544             "Discrete barrier certificate. For  $h_\sigma(U)=\text{BASIN\_TOL}^2-(U-\sigma)^2$  and implementation margin  $m=\max(\text{EPS}, \text{BASIN\_TOL}^2-9)$ , the canonical post-projection clamp gives  $|U-\sigma|\leq \text{BASIN\_TOL}-m$ , hence  $h_\sigma(U+)=2*\text{BASIN\_TOL}^2-m^2>0$  for every finite pre-projection  $U$ . This is an exact one-jump reachability and sampled-state invariance certificate for the locked signed basin. It is stronger than a finite grid observation but does not claim continuous-time safety between projection events.",
19545             "Conditional S-flow contraction. Since  $F_\text{state}'(S)=-\alpha_s(3/2)\beta_s S$ , any interval  $I$  with  $\alpha_s(3/2)\beta_s S\geq\mu>0$  is contractive for the isolated S dynamics. Solutions that remain in  $I$  satisfy  $|S_1(t)-S_2(t)|\leq \exp(-\mu t)|S_1(0)-S_2(0)|$ . This supplies an explicit contraction margin and promotion gate without extending the result to the coupled six-state system.",
19546             "Local Lipschitz proposition. On any compact domain  $D$  on which  $E_\text{max}$  is bounded below by a positive constant, the continuous Piece I vector field is continuously differentiable because it is composed of polynomials, tanh, cosine, affine terms, and divisions only by  $E_\text{max}$  and  $Q_B$  bounded away from zero. Therefore  $f$  is Lipschitz on  $D$  with an explicit computable bound  $L_D = \sup_{\{x \text{ in } D, t \text{ in } [0, T]\}} \|J_f(x, t)\|$ . The complete Jacobian entries are determined by the printed equations; the finite numerical evidence reports sampled local stiffness diagnostics but is not represented as

```

```

the global supremum  $L_D$ .",
19547     "RK4 error bound. If  $f$  has bounded derivatives through order five on  $D$  and the exact and numerical solution
s remain in  $D$ , classical RK4 has local truncation error  $O(h^5)$  and global error  $O(h^4)$ . A conservative global form is
 $|e_n| \leq ((\exp(L_D T) - 1)/L_D) C_5 M_5 h^4$ , where  $M_5$  bounds the required fifth total derivative and  $C_5$  is the RK4 met
hod constant. The report separately supplies observed refinement order and DOP853 concordance; those measurements valid
ate the tested execution but do not replace the stated assumptions.",
19548     "Projection non-expansiveness theorem. For a declared signed basin interval  $I_{\sigma}=[\sigma-\tau, \sigma+\tau]$ ,
the scalar clipping projection  $\Pi_I$  is 1-Lipschitz:  $|\Pi_I(a) - \Pi_I(b)| \leq |a - b|$ . Because  $P_{\sigma}$  leaves the other five c
oordinates unchanged, its Euclidean extension is non-expansive. Proof: metric projection onto a closed convex interval
is non-expansive; applying the identity to the remaining coordinates preserves the inequality.",
19549     "Conditional Banach theorem. Let  $R_h$  be the one-microstep RK4 map restricted to a complete metric subset  $X$ 
of the declared basin, and suppose  $\|R_h(x) - R_h(y)\| \leq q\|x - y\|$  for  $q < 1$ . Since  $P_{\sigma}$  is non-expansive,  $\|P_{\sigma} R_h$ 
 $(x) - P_{\sigma} R_h(y)\| \leq q\|x - y\|$ . Banach's fixed-point theorem then gives one fixed point in  $X$  and geometric convergenc
e from every initial point in  $X$ . The engine does not claim that  $q < 1$  has been established globally; the theorem identifi
es the exact additional condition required.",
19550     "Conditional local Lyapunov theorem. For an equilibrium  $x^*$  of a continuously differentiable active subsystem
m with Hurwitz linearization  $A$ , choose  $Q$  positive definite and solve  $A^T P + P A = -Q$ . If the nonlinear remainder obeys
 $\|r(z)\| \leq \gamma\|z\|^2$  locally,  $V(z) = z^T P z$  decreases for  $\|z\| < \lambda_{\min}(Q)/(2\|P\|\gamma)$ . The reported 5/6 vec
tor-field Jacobian rank is not a controllability test:  $I_U$  is an observer channel absent from the other derivatives. A
separate input matrix and controllability/observability analysis are required before any full-state control claim.",
